Normal mode Runs for 20 seconds

Indeterminate mode Runs for 10 seconds

Description and Resources

The ProgressIndicator component can be used to inform the user of actions that take a long time to finish, such as file uploads or search queries.

Updates to the indicator happen via polling, and the default polling interval is 1 second.

Overview

RotaryKnob component emulates its real-world counterpart and is simply used for selecting numeric value within a range. Knob can be rotated by dragging mouse along y-axis, using mouse scroll wheel or pressing up/down keys. Component also supports browser focus events.

Getting Started with Vaadin

By Marko Grönroos

ABOUT VAADIN

Vaadin is a server-side Ajax web application development framework that allows you to build web applications just like with traditional desktop frameworks, such as AWT or Swing. An application is built from user interface components contained hierarchically in layout components.

In the server-driven model, the application code runs on a server, while the actual user interaction is handled by a client-side engine running in the browser. The client-server communications and any client-side technologies, such as HTML and JavaScript, are invisible to the developer. As the client-side engine runs as JavaScript in the browser, there is no need to install plug-ins. Vaadin is released under the Apache License 2.0.

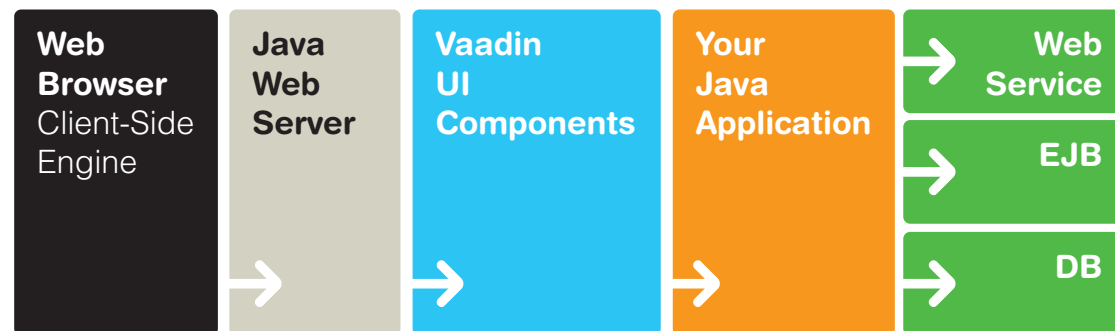

Figure 1: Vaadin Client-Server Architecture

If the built-in selection of components is not enough, you can

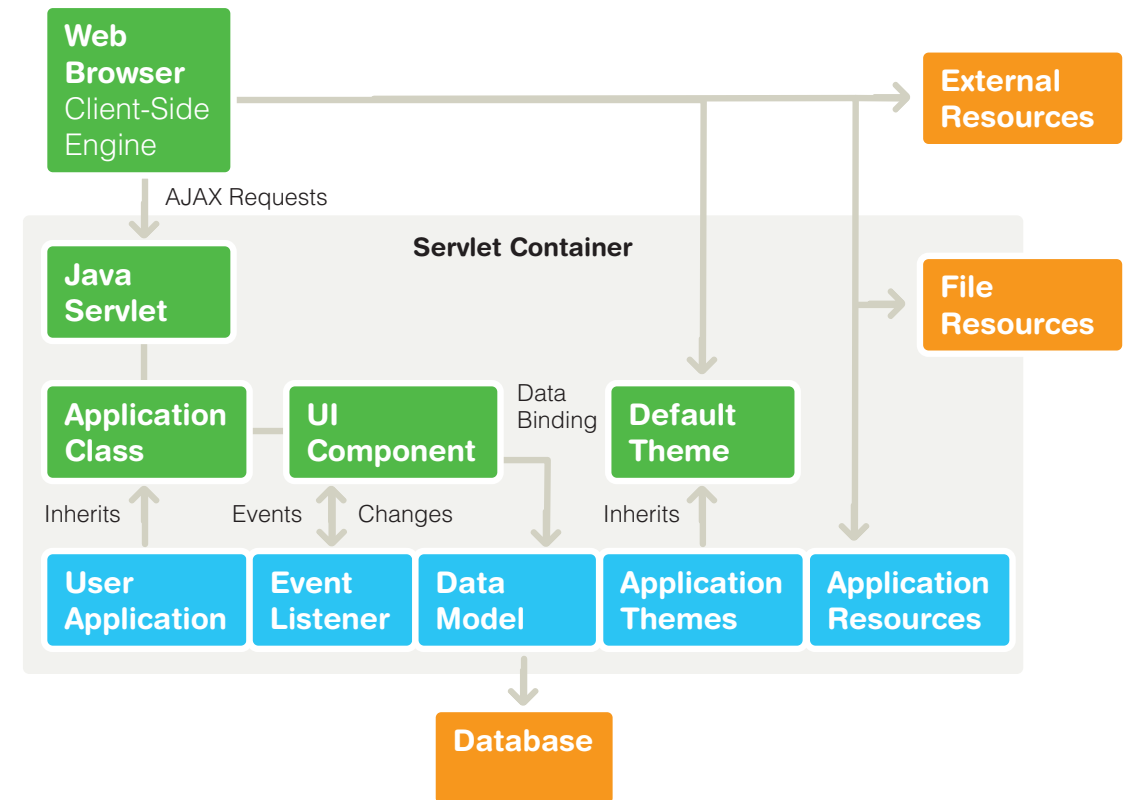

Figure 2: Architecture for Vaadin Applications

You can get a reference to the application object from any component attached to the application with `getApplication()`

Event Listeners

In the event-driven model, user interaction with user interface components triggers server-side events, which you can handle
