
LESS = MORE

The next generation of Java applications

Matthew Fowler, NT/e

www.cloudtran.com
cloudslave.blogspot.com

Introduction

- MF
- NT/e
- CloudTran
- The architect's equation (pto)

Less = More

- Less (Risk x Time To Market x
Capex x Opex)

==

More (Items x Data/Item x Processing x
Reliability x Responsiveness x
Elasticity)

\$20

Mechanics versus electronics

10 second delay

Controller → disk surface

Mainstream In-Memory Data Grids

Responsiveness

- Where will the demand come from?
 - Use of mobile apps
 - More intelligence
 - Globalisation

The Transportation Business

Currently we mostly shovel data around...

we should be in the information business

Electronics Real Estate Business

Colocation

Colocation

Colocation

DB versus in-memory accesses

- Read 1 Customer, 9 Orders
- All cached- no disk IO

	μs	<u>In-Memory</u>	<u>LAN-DB</u>
CPU		6	474
Elapsed		8	1480

Note: The values 6, 474, 8, and 1480 are circled in orange in the original image. The text '79x Throughput' is placed between 6 and 474, and '185x Reponse time' is placed between 8 and 1480.

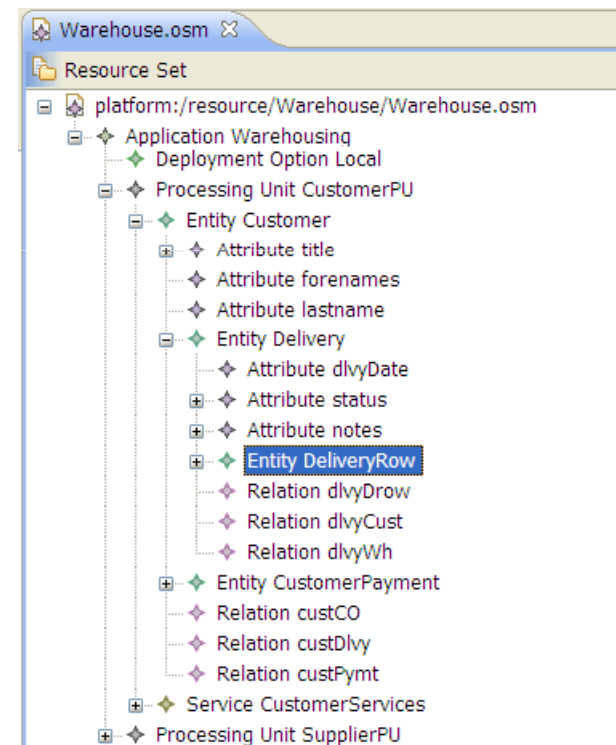

Does 80x or 180x matter?

- Not when architecture is static
- Not if I can buy from a big company
- Not when there's enough oil

- Wanna buy my used Accord for \$1.8m?

Entity Groups

- How much in-memory - depends on app
- Entity Groups for locality of reference
- Transactions span entity groups

Problems with the cloud

- Data hierarchy and transactions
- SQL / NoSQL
- Distributed programming
- New platforms and concepts
- For enterprises
 - Back end persistence
 - In grid

Explaining it to your Mom / Boss

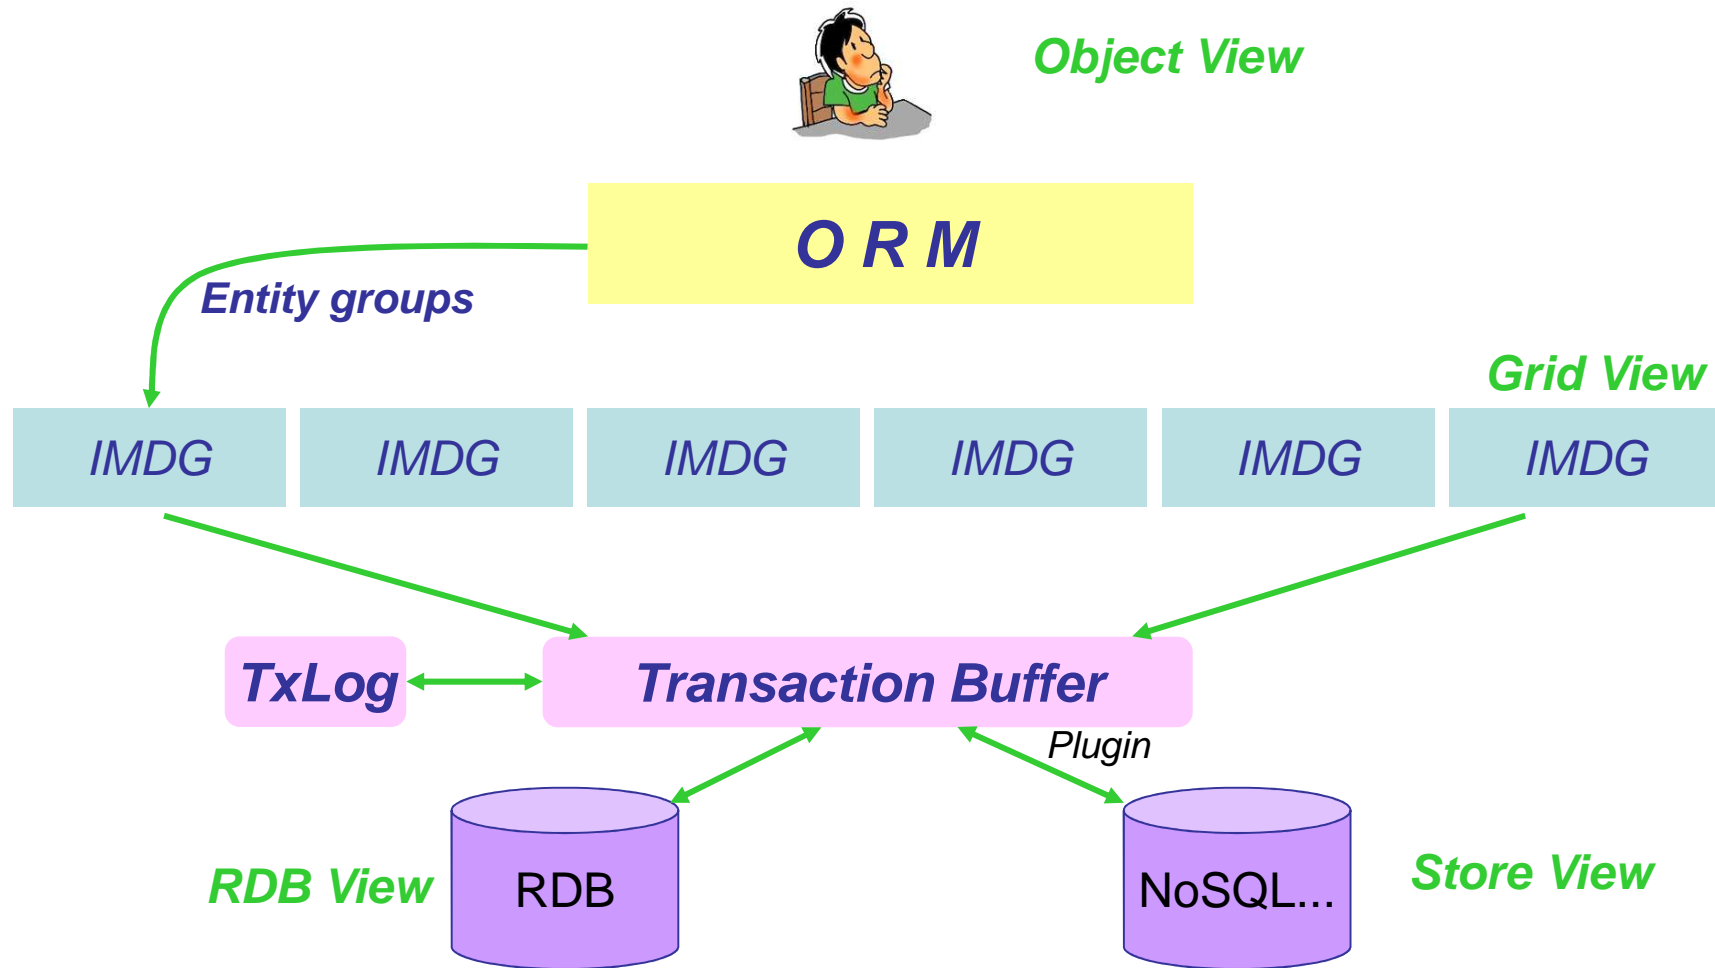

IMDG - SOR

Persistent Storage

CloudTran

How does CloudTran work ?

~~Distributed~~ Cloud Transactions

What the reviewers said

“you're solving the biggest problem in Cloud computing: persistence and performance haven't been pushed close together” UBS Architect

“Data management is shaping up to be a significant problem in the cloud, and I think you have a workable solution” Industry Commentator

“no-SQL may be all well and good for developers trying out cloud for the first time, or for a brand new application, but for production applications you need to use existing IT skills and technologies” Industry Commentator

4. Quick and Simple

\$20

Amazon Test Setup

- One hour
 - 2x High CPU Extra Large: \$6.60
 - 20x High CPU Medium: 10.40
 - RDS Double Extra Large: 1.55
 - Total \$18.55
- 10 million transactions

CloudTran Summary

Platform for mainstream Java developers

- to use IMDG
- for scalable, commercial applications
- without worry and minimal hassle
- for commercial advantage

Questions, comments, vicious attacks ?
