Cloud Computing?

It's like
computers on the
internet, innit.

<http://upload.wikimedia.org/wikipedia/en/5/51/Metropolis.jpg>

Disruptive shift of
the computing
stack to online
services.

It's like
computers on the
internet, innit.

£10,000 please.

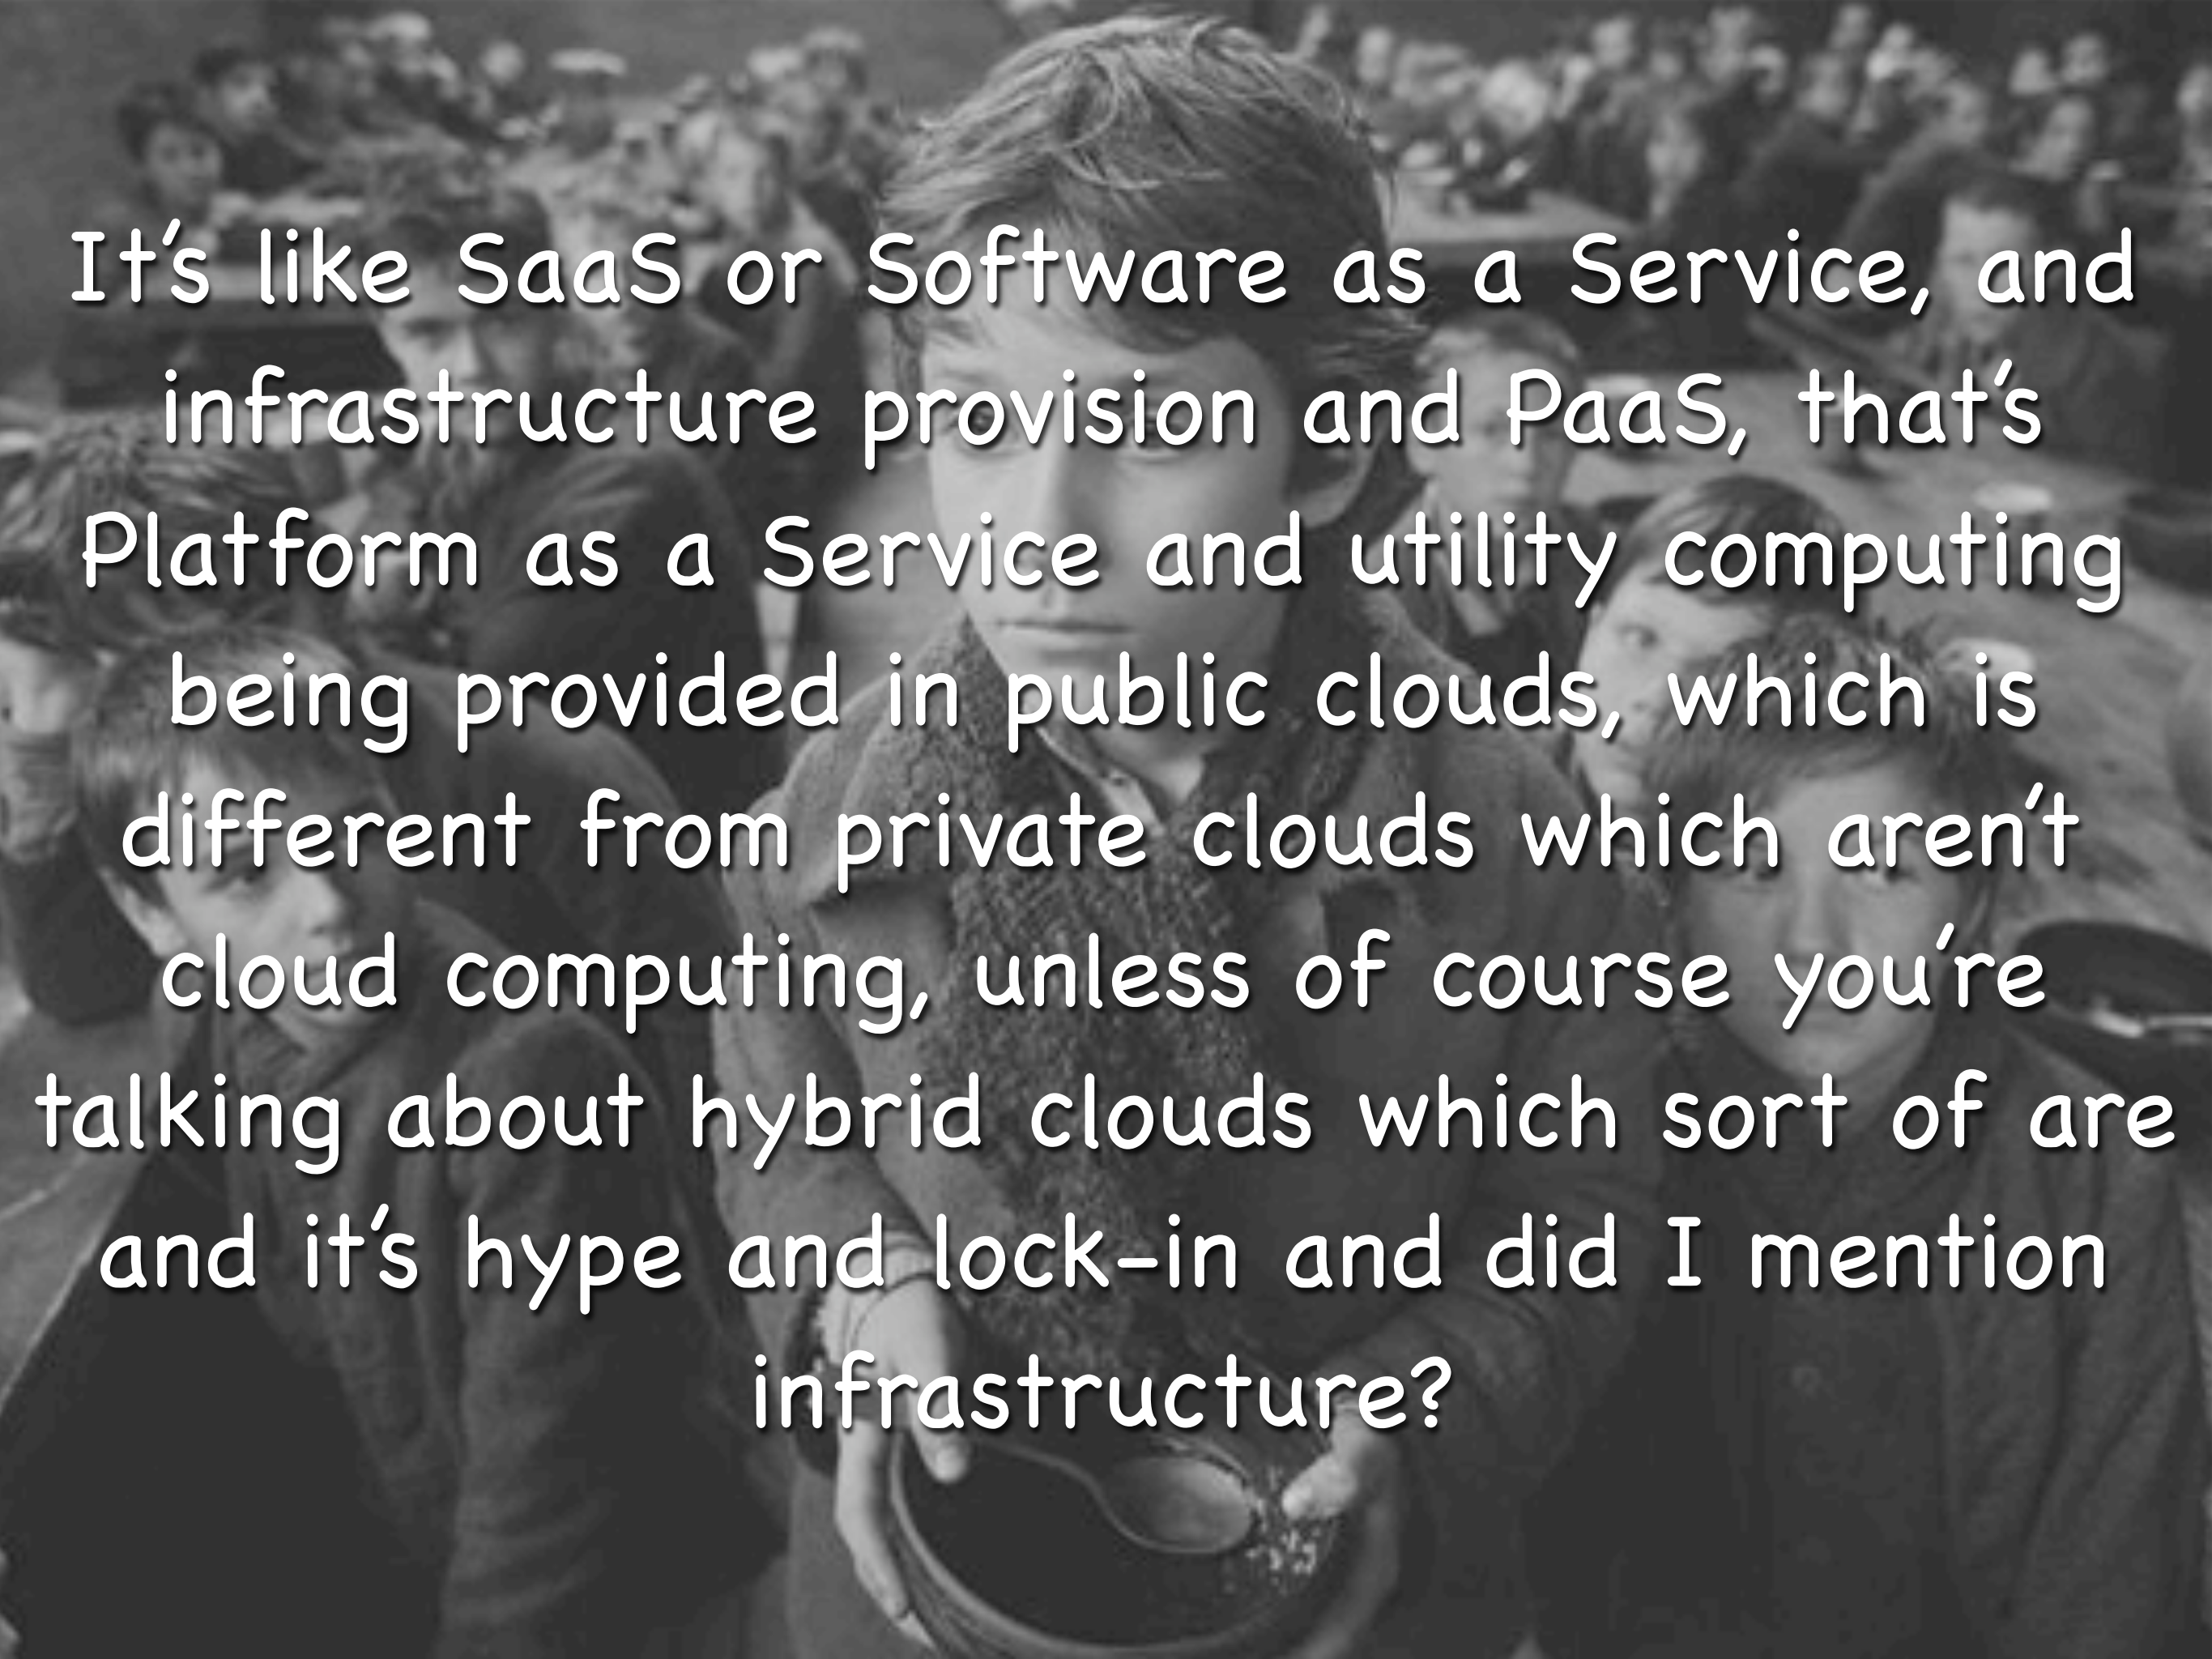

Image from Oliver Twist

A black and white photograph of a young boy with dark, wavy hair, looking down at a small object in his hands. He is wearing a dark jacket over a light-colored shirt. He is surrounded by a crowd of people, mostly children, who are out of focus in the background. The text is overlaid on the image in a white, sans-serif font with a slight drop shadow.

It's like SaaS or Software as a Service, and infrastructure provision and PaaS, that's Platform as a Service and utility computing being provided in public clouds, which is different from private clouds which aren't cloud computing, unless of course you're talking about hybrid clouds which sort of are and it's hype and lock-in and did I mention infrastructure?

67 definitions

448 slides

**1. On-demand self-service Internet infrastructure where you pay-as-you-go and use only what you need, all managed by a browser, application or API. Cloud computing is broken up into multiple segments including: Cloud Infrastructure, Cloud Platforms and Cloud Applications.
(see "Cloud Pyramid")**

No definition

Cloud = Our Product

NIST

(National Institute of
Science & Technology)

Version 15

Note 1: Cloud computing is still an evolving paradigm. Its definitions, use cases, underlying technologies, issues, risks, and benefits will be refined in a spirited debate by the public and private sectors. These definitions, attributes, and characteristics will evolve and change over time.

Note 2: The cloud computing industry represents a large ecosystem of many models, vendors, and market niches. This definition attempts to encompass all of the various cloud approaches.

Definition of Cloud Computing:

Cloud computing is a model for enabling convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction. This cloud model promotes availability and is composed of five essential characteristics, three service models, and four deployment models.

Essential Characteristics:

On-demand self-service. A consumer can unilaterally provision computing capabilities, such as server time and network storage, as needed automatically without requiring human interaction with each service’s provider.

Broad network access. Capabilities are available over the network and accessed through standard mechanisms that promote use by heterogeneous thin or thick client platforms (e.g., mobile phones, laptops, and PDAs).

Resource pooling. The provider’s computing resources are pooled to serve multiple consumers using a multi-tenant model, with different physical and virtual resources dynamically assigned and reassigned according to consumer demand. There is a sense of location independence in that the customer generally has no control or knowledge over the exact location of the provided resources but may be able to specify location at a higher level of abstraction (e.g., country, state, or datacenter). Examples of resources include storage, processing, memory, network bandwidth, and virtual machines.

Rapid elasticity. Capabilities can be rapidly and elastically provisioned, in some cases automatically, to quickly scale out and rapidly released to quickly scale in. To the consumer, the capabilities available for provisioning often appear to be unlimited and can be purchased in any quantity at any time.

Measured Service. Cloud systems automatically control and optimize resource use by leveraging a metering capability at some level of abstraction appropriate to the type of service (e.g., storage, processing, bandwidth, and active user accounts). Resource usage can be monitored, controlled, and reported providing transparency for both the provider and consumer of the utilized service.

Service Models:

Cloud Software as a Service (SaaS). The capability provided to the consumer is to use the provider’s applications running on a cloud infrastructure. The applications are accessible from various client devices through a thin client interface such as a web browser (e.g., web-based email). The consumer does not manage or control the underlying cloud infrastructure including network, servers, operating systems, storage, or even individual application capabilities, with the possible exception of limited user-specific application configuration settings.

Cloud Platform as a Service (PaaS). The capability provided to the consumer is to deploy onto the cloud infrastructure consumer-created or acquired applications created using programming languages and tools supported by the provider. The consumer does not manage or control the underlying cloud infrastructure including network, servers, operating systems, or storage, but has control over the deployed applications and possibly application hosting environment configurations.

Cloud Infrastructure as a Service (IaaS). The capability provided to the consumer is to provision processing, storage, networks, and other fundamental computing resources where the consumer is able to deploy and run arbitrary software, which can include operating systems and applications. The consumer does not manage or control the underlying cloud infrastructure but has control over operating systems, storage, deployed applications, and possibly limited control of select networking components (e.g., host firewalls).

Deployment Models:

Private cloud. The cloud infrastructure is operated solely for an organization. It may be managed by the organization or a third party and may exist on premise or off premise.

Community cloud. The cloud infrastructure is shared by several organizations and supports a specific community that has shared concerns (e.g., mission, security requirements, policy, and compliance considerations). It may be managed by the organizations or a third party and may exist on premise or off premise.

Public cloud. The cloud infrastructure is made available to the general public or a large industry group and is owned by an organization selling cloud services.

Hybrid cloud. The cloud infrastructure is a composition of two or more clouds (private, community, or public) that remain unique entities but are bound together by standardized or proprietary technology that enables data and application portability (e.g., cloud bursting for load-balancing between clouds).

Note: Cloud software takes full advantage of the cloud paradigm by being service oriented with a focus on statelessness, low coupling, modularity, and semantic interoperability.

Note 1:

**Cloud computing is
still an evolving
paradigm.**

We don't know
what "cloud" is yet.

3 service models

4 deployment models

5 essential characteristics

A penguin wearing a black top hat and a white shirt with a black bow tie stands in the foreground. In the background, a green steam train with a smiling face is at a station platform. The train has a red buffer and is on tracks. A speech bubble is overlaid on the image.

Trains have wheels,
they move along a track
and are run by public &
private operators

Why trains?

“The real thing to do today is to capture, what are the dimensions of the **thing** that literally, I will tell you, we’re betting our company on, and I think pretty much everybody in the technology industry is betting their companies on”

Microsoft CEO, Steve Ballmer

The image shows three crocheted dolls nestled in a bed of dry straw. In the upper right, a doll with a peach-colored face, black hair in two buns, and a black body. In the upper left, a white doll with small blue eyes. In the lower left, a red-orange doll. A third peach-faced doll is partially visible in the center. Three speech bubbles are overlaid on the image, containing text.

We don't know
what "cloud" is yet

but bet your
company on it

everybody else is ...

What is
Industrial
Revolution?

A black and white photograph of a man in a suit and glasses, looking thoughtful with his hand to his chin. The image is overlaid with large, white, sans-serif text that reads: "It's like mechanised horses, innit." The text is centered and spans across the middle of the image. The background is a slightly blurred photograph of the man, who is wearing a dark suit, a white shirt, and a dark tie. He has short hair and is wearing glasses. His right hand is raised to his chin, with his index finger pointing upwards. The overall tone of the image is serious and contemplative.

It's like
mechanised
horses, innit.
