

# Runtime Analytics

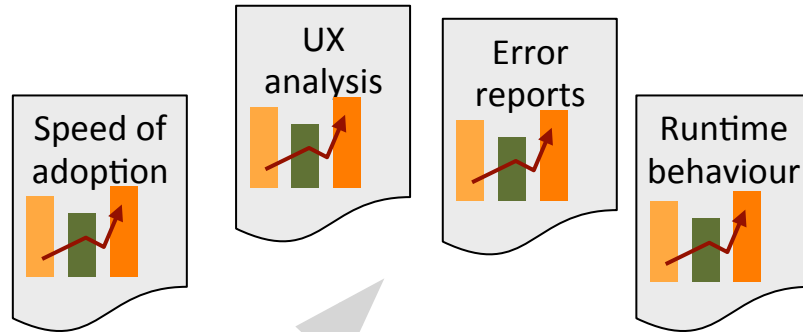

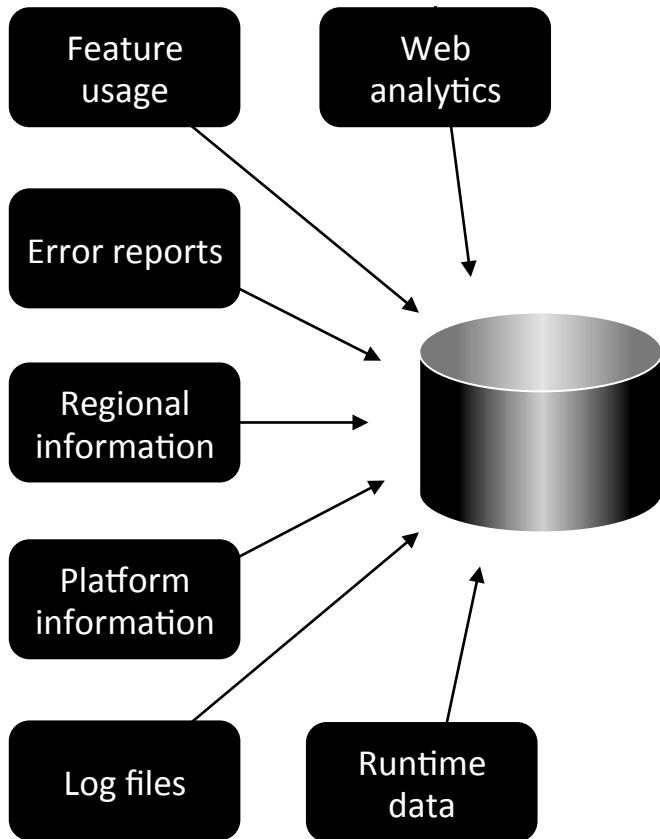

or finding out what your users  
really think of your software

**Jonathan Allin**  
Product manager and evangelist

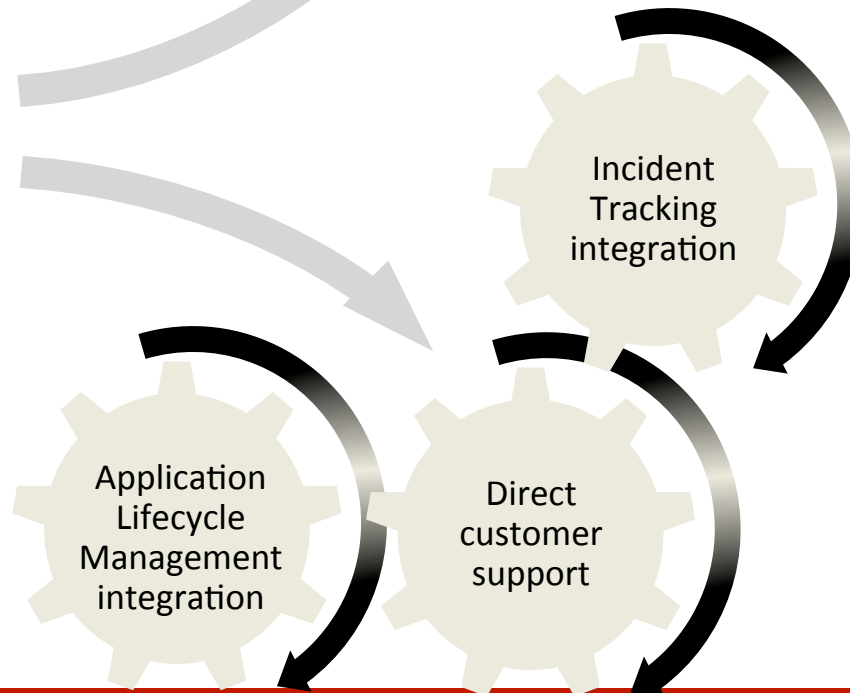

redgate<sup>®</sup>  
ingeniously simple tools

# A definition for Runtime Analytics

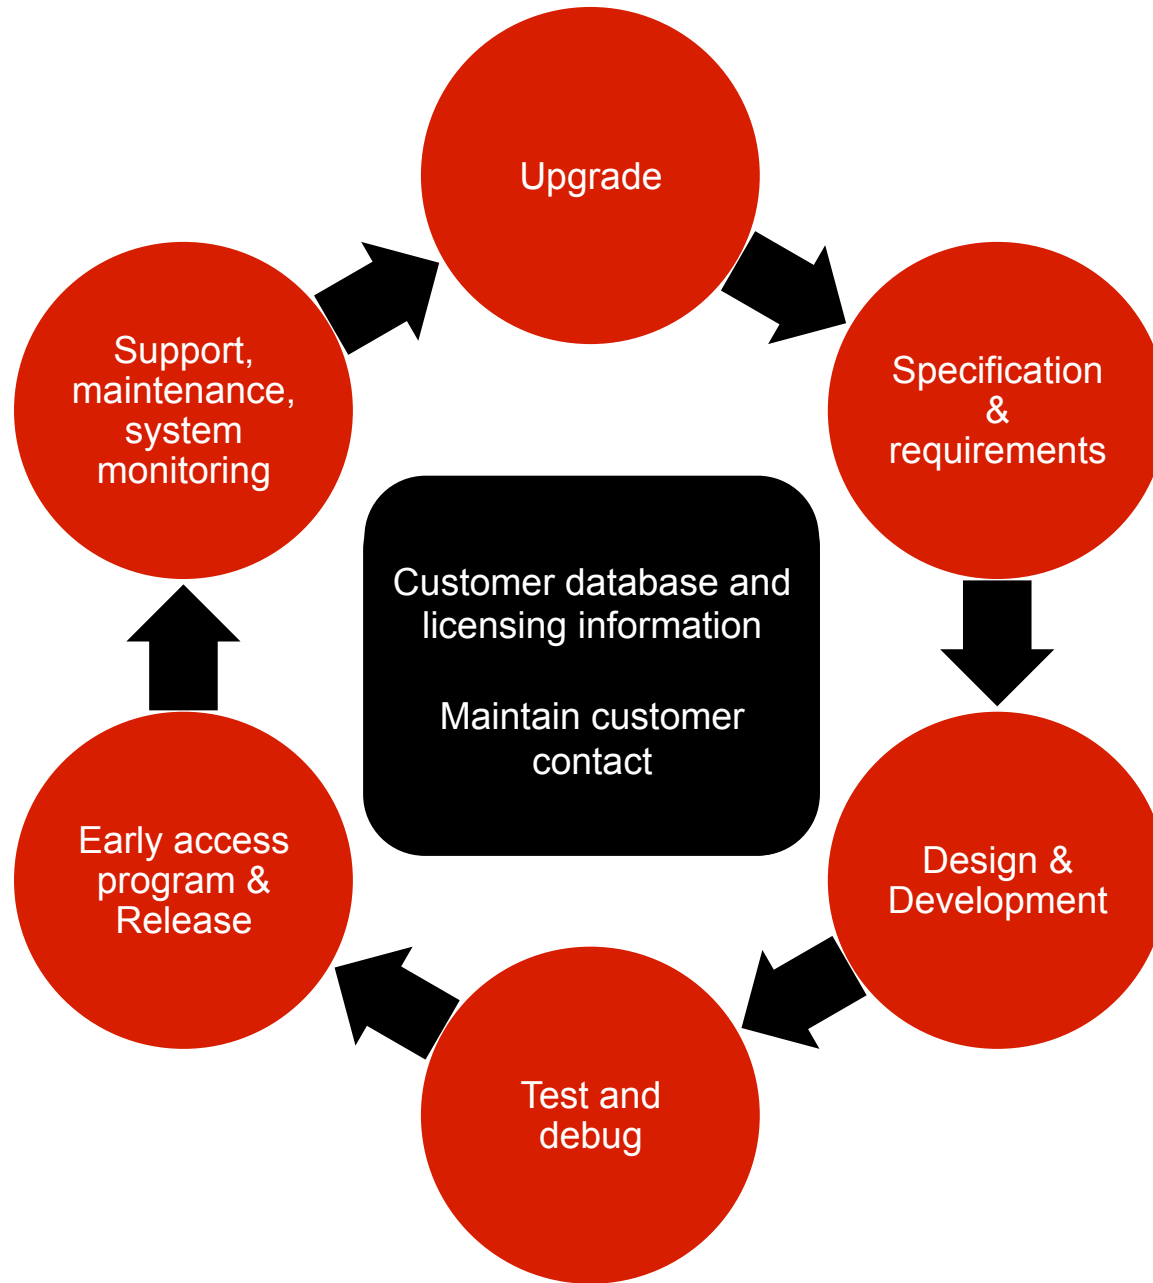

1. Collects and stores comprehensive information about how users interact with your applications

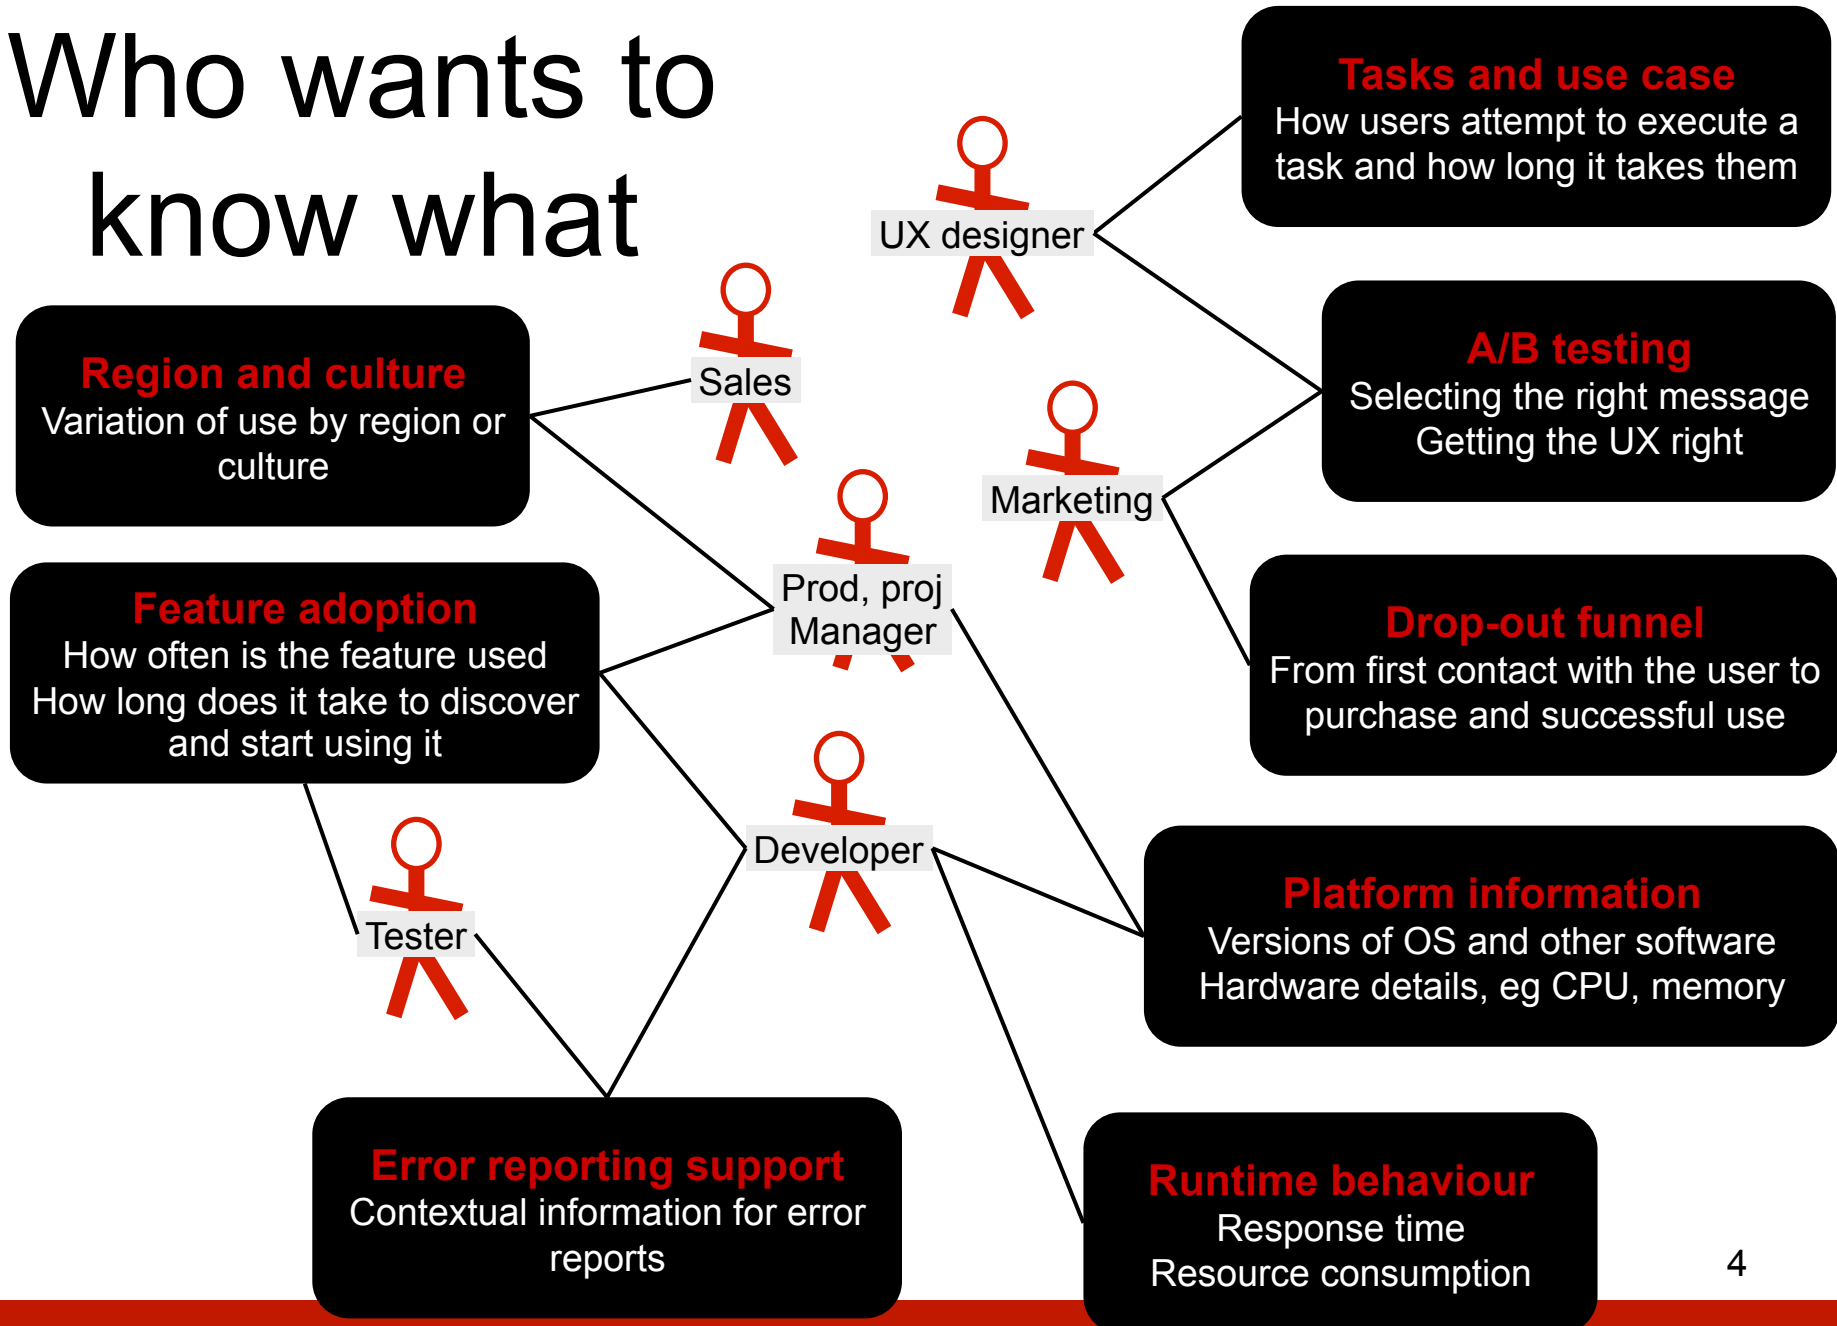

2. Provides functions and reports to analyse the information

3. And tools that act on the information

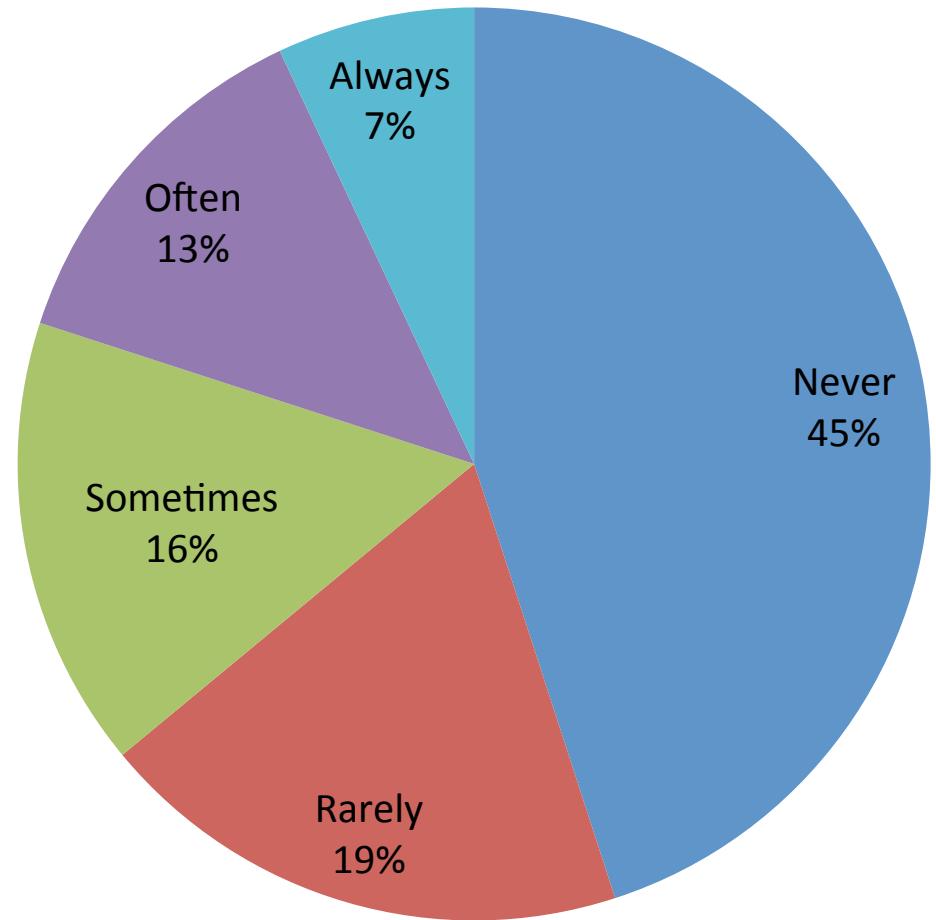

# Who wants to know what

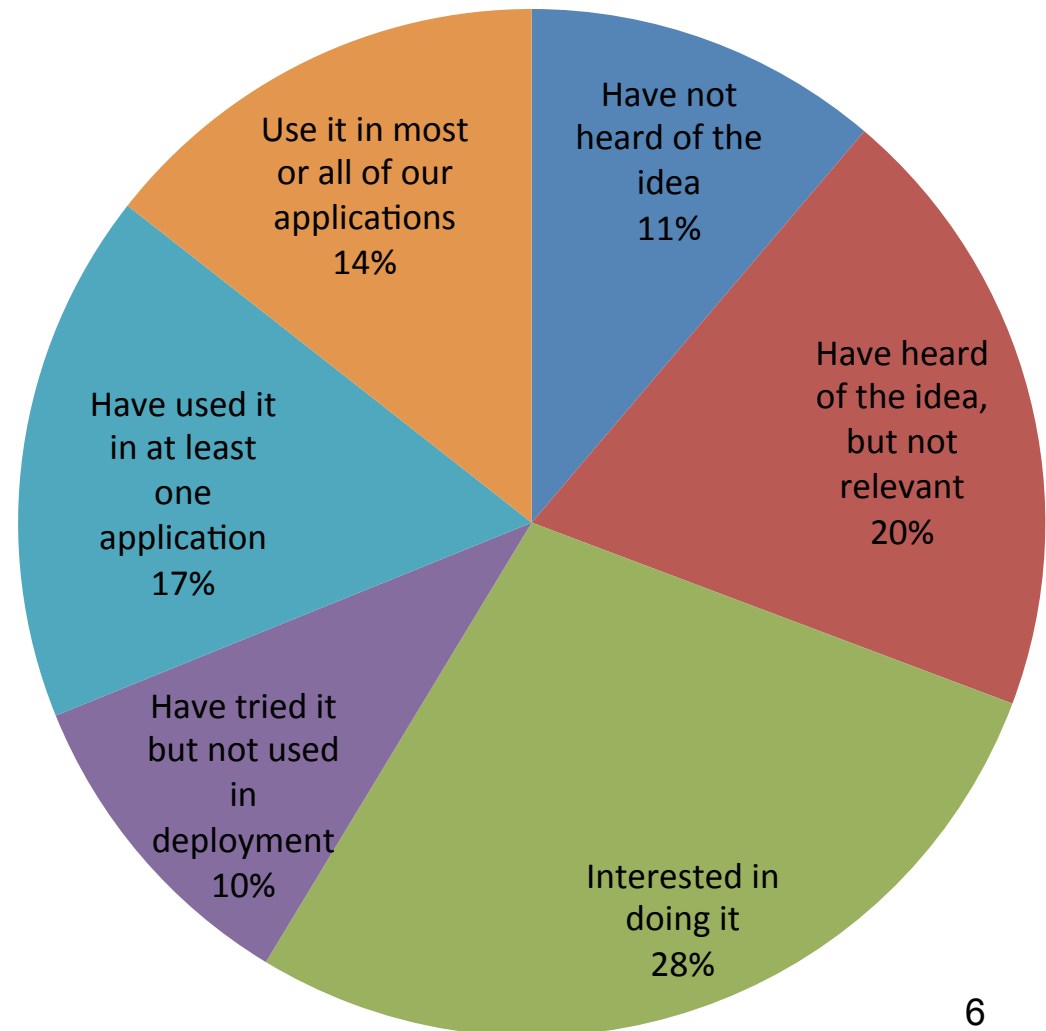

# We need to know what's valuable

- How often is a feature used?
  - *Data from The Standish Group*

# Do you ever automatically gather data on how your applications are used?

- Only 14% of respondents make regular use of runtime analytics
  - *Data from Red Gate survey. ~220 respondents*

# Two contentions

1. We should all be concerned about how our customers use our products
  - and how our products behave in the field
2. Runtime analytics will multiply ROI
  - It's not just an incremental benefit

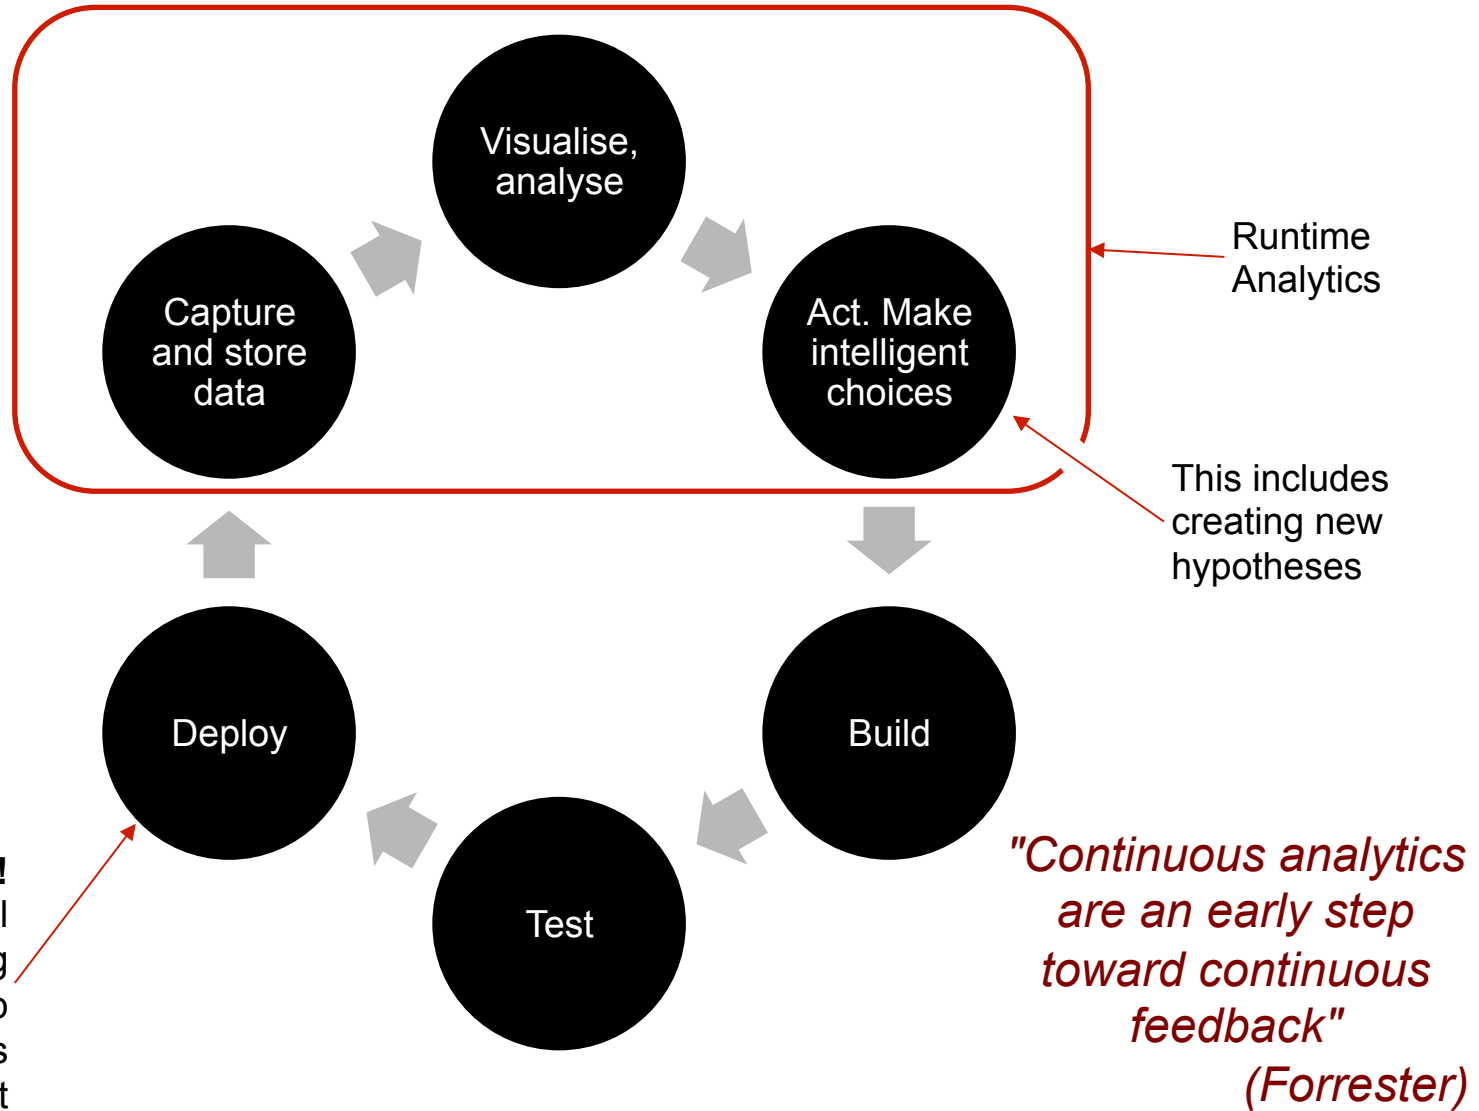

# ANTS Memory Profiler

**Percentage of sessions in which a memory snapshot was taken by new users**

# Build Measure Learn

# Lean Startup

- You have a promising idea
- But there are lots of unknowns
  1. Is there a market
  2. Can you reach the market
  3. Is it technically feasible
  4. ...

# Lean Startup in principle

- Get answers to the big unknowns as **quickly** and **painlessly** as possible
- Break down these unknowns into experiments of one or two weeks
  - Form a testable question
  - Run the experiment
  - Adapt the product

*The "product" could be a marketing message, a report mock-up, a magic website, or a minimal implementation*

*An "experiment" can be an investigation, updating a website, releasing the next version, ...*

# Lean Startup in practice

- Experiments replace Agile Sprints
- Fast validated learning cycles

↳ **Build** ⇒ **Measure** ⇒ **Learn** ↗

- **Swarming**
  - Can appear inefficient
  - But maintains velocity
  - Reduces work in progress
- **Fix as you go**
  - Don't stack up issues and faults in a tracking system
- **Weekly discussions**
  - Review results of completed experiment(s)
  - Adjust expectations
  - Build new experiments to test new expectations

## Runtime Analytics

Provides automatic data collection (from website or application)  
Keeps your key metrics up-to-date and visible to the whole team  
Augments, but doesn't replace, direct customer contact

# Unknown #1: Is there a market?

- Can you identify a value proposition for your potential market?
- Magic website
  - Minimal content
  - Find out if customers are interested
    - Measuring hits provides little information
  - Collect email addresses
    - Don't ask for lots of details
- Talk to a few people who represent the market
  - ie are **proxies** for the market
  - Present the simplest possible product
    - eg mocked up screen shots, Flash demo, paper reports, a verbal picture, ...
  - Is your proposition of value to them?
  - If not, modify your proposition (or bail out)

# Building the simplest product

- MVP: Minimal viable product
  - Has a value proposition
    - ie customers would pay something for it
  - Can be implemented quickly and easily
    - May deliver just a single feature
    - No bells and whistles
- Measure the response
  - **Runtime analytics**
  - Talk to your market proxies
- Learn, eg
  - Is it being used as you expected
  - Is it being used successfully
  - Is it sticky
- Continue around the loop
  - Modify and extend the product based on what you have learnt
  - Implement these changes as MVPs

*Don't worry  
about technical  
debt*

# Unknown #2: Can you reach the market?

- How do you get your potential customers to notice you or take you seriously?
- Do you have to go through a reseller or other intermediary?
  - What are their pain points?
- Use your market proxies
  - Find out which journals they read, which conferences they attend, which websites they use, what they search for, their user groups, who they listen to, how they buy, ...

# Unknown #3: Is it feasible?

- Do you have, or can you acquire, the necessary resources, knowledge, processes, to build your value proposition?
- Test the high risk areas - in the field
  - **Measure** runtime behaviour
- Don't attempt to build a complete solution
  - Use prototypes, experiments, etc

# Measure what matters

Avoid "vanity" metrics

## What matters

- Customer benefit
- Retention (or stickiness)
- Speed of adoption
  - Of a feature or application
- Success rate for completing a task
  - And how long it takes

## What probably doesn't

- Metrics that don't teach you anything
- Or that can be the result of a campaign
- Examples
  - Unique visitors
  - Number of downloads
  - Sales growth

### Measure your engine of growth

1. Paid: old customers cover the cost of acquiring new customers (eg dating business)
2. Viral: word of mouth (eg facebook)
3. Engagement or stickiness: (eg software leasing)

# SQL Connect

The screenshot displays the Microsoft Visual Studio interface with the SQL Connect extension. The main window shows a SQL query editor with the following code:

```
ALTER PROCEDURE [dbo].[uspGetContacts]
AS
SELECT Title ,
       FirstName ,
       LastName
FROM Person.Contact
```

The Solution Explorer on the right shows a project named 'MyMVCWebApp' (2 projects) containing a database project 'AdventureWorks'. The 'Stored Procedures' folder is expanded, showing a list of procedures including 'dbo.uspGetContacts', which is highlighted with a red circle.

The SQL Connect window at the bottom left shows the following status:

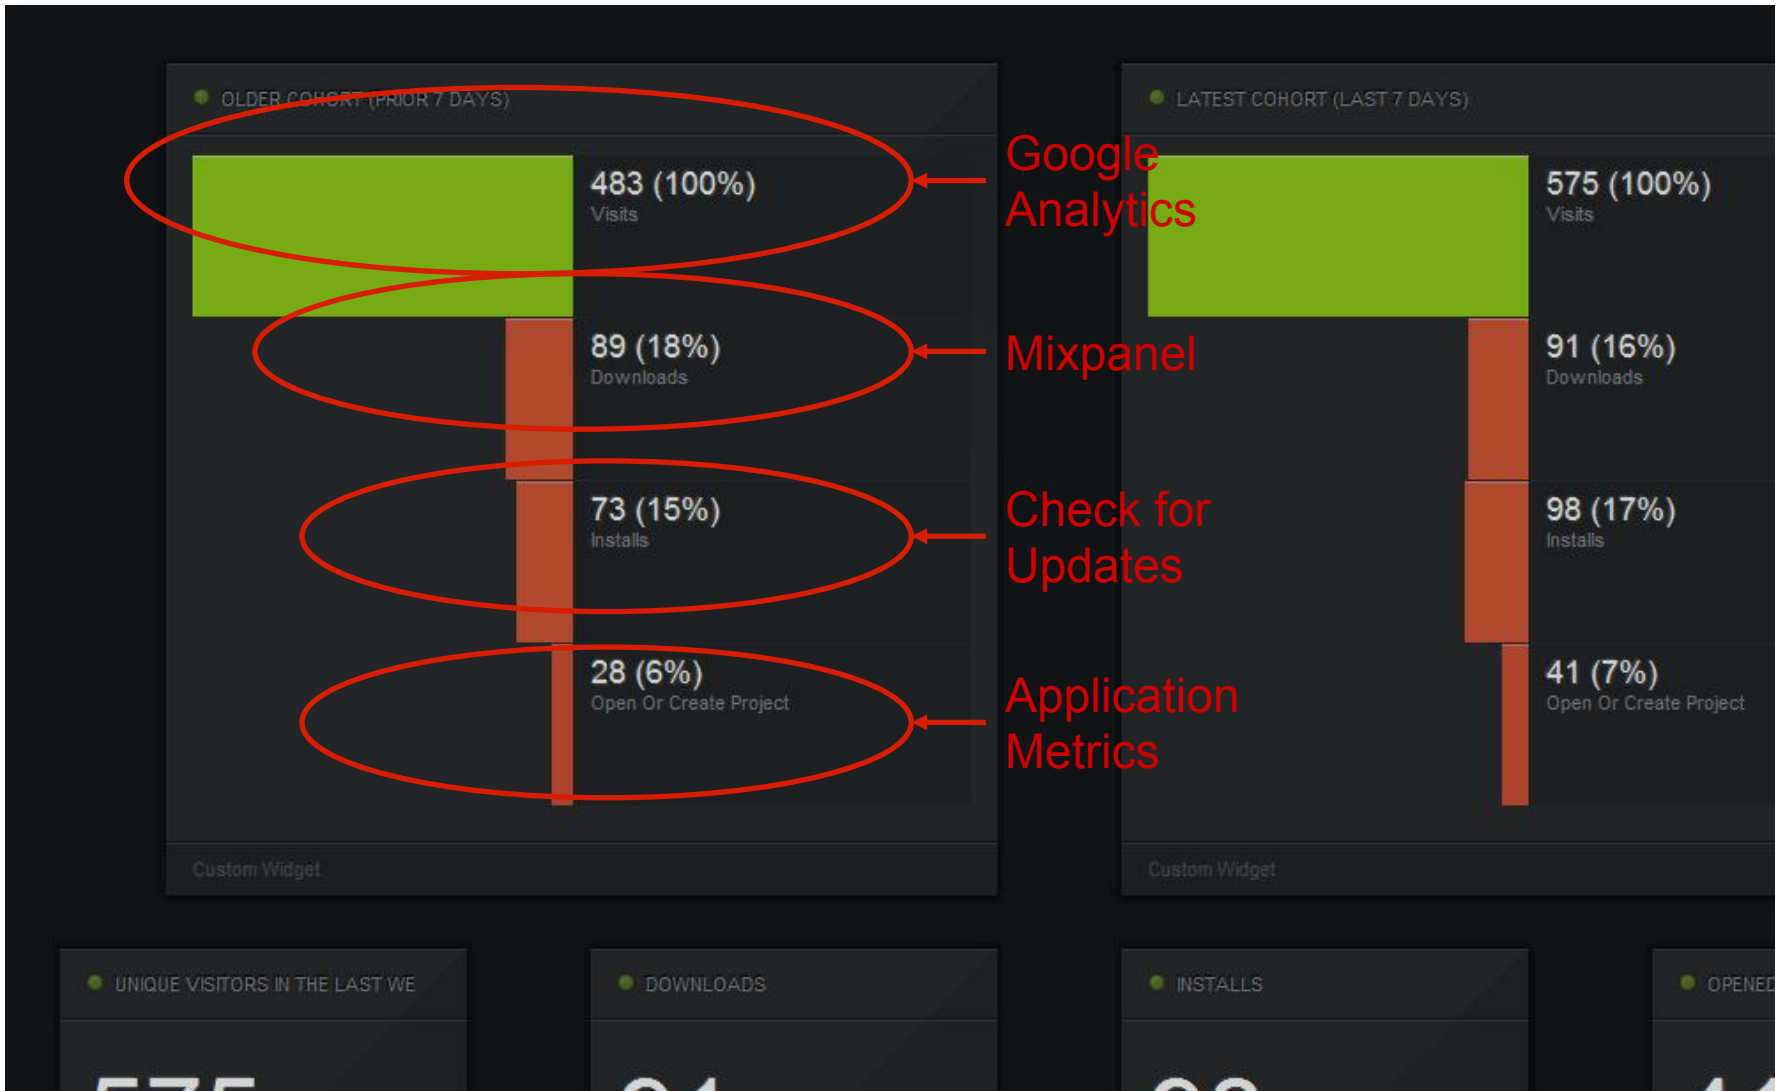

- Refresh
- Synchronize
- 0 Conflicted Changes
- 0 Changes to the Connected Database
- 0 Changes to the Offline Creation Scripts
- 150 Identical Objects

Four red callout boxes provide instructions:

- 1. Add a new project**  
The Red Gate Database Project lets you work connected to a database in real time, within Visual Studio.
- 2. Make a Change**  
Here, we've modified a stored procedure, and executed the SQL.
- 3. Refresh and Synchronize**  
Review changes you've made and synchronize your database and project.
- 4. Track changes**  
See changes in the Solution Explorer when you synchronize the project.  
You can then commit and share changes with your existing source control system. Here we're using SVN and AnkhSVN.

The Messages window at the bottom shows the command completed successfully. The status bar at the bottom indicates 'Ready' and 'Pending Changes'.

# Monitoring the right metrics

# Measuring runtime behaviour (and avoiding an expensive release)

The screenshot shows the Redgate SQL Source Control interface. At the top, there are tabs for 'SQL Source Control', 'PDM-DAVIDA2\SQL...- Person.Address', 'SQL Test', and 'SQL Search'. Below the tabs, there's a navigation bar with 'Commit Changes', 'Get Latest', 'Migrations', and 'Setup'. The 'AdventureWorks' logo is visible on the right. A status bar indicates 'Adding new State field to Address table' with a 'Commit' button.

Changed By	Change Type	1 of 4 objects with changes to commit	Type	Owner
David.Atkinson	Edit	<input checked="" type="checkbox"/> Address	Table	Person
Jeff	New	<input type="checkbox"/> vProduct	View	dbo
Kevin	New	<input type="checkbox"/> Dining	Table	dbo
Marie	New	<input type="checkbox"/> usp_GetEmployees	Stored Procedure	Person

Below the table, there are navigation buttons: 'Show', 'Previous', 'Next', and a comparison tool showing 'Database version' vs 'Latest source control version'.

The main area displays a SQL code diff for the 'Address' table. The left pane shows the current code, and the right pane shows the latest source control version. The diff highlights the addition of a new column: `[State] [nchar] (2) COLLATE Latin1_General_10`.

# How quickly is the trace file overwritten?

The screenshot shows the SQL Source Control interface. At the top, there's a title bar 'SQL Source Control' and a navigation bar with 'Commit Changes', 'Get Latest', 'Migrations', and 'Setup'. The 'Evaluation Repository' is active, and there are links for 'Provide Feedback' and 'Help'. The 'redgate' logo is visible. Below the navigation bar, the current repository is 'AdventureWorksOriginal'. A text box for 'Comment to add on commit' is present, along with a 'Commit' button and a refresh icon. The main area displays a table of objects to be committed, with a summary '0 of 126 objects with changes to commit'. The table has columns for 'Changed By', 'Change Type', 'Object Name', 'Type', and 'Owner'. The 'Contact' table is highlighted in yellow.

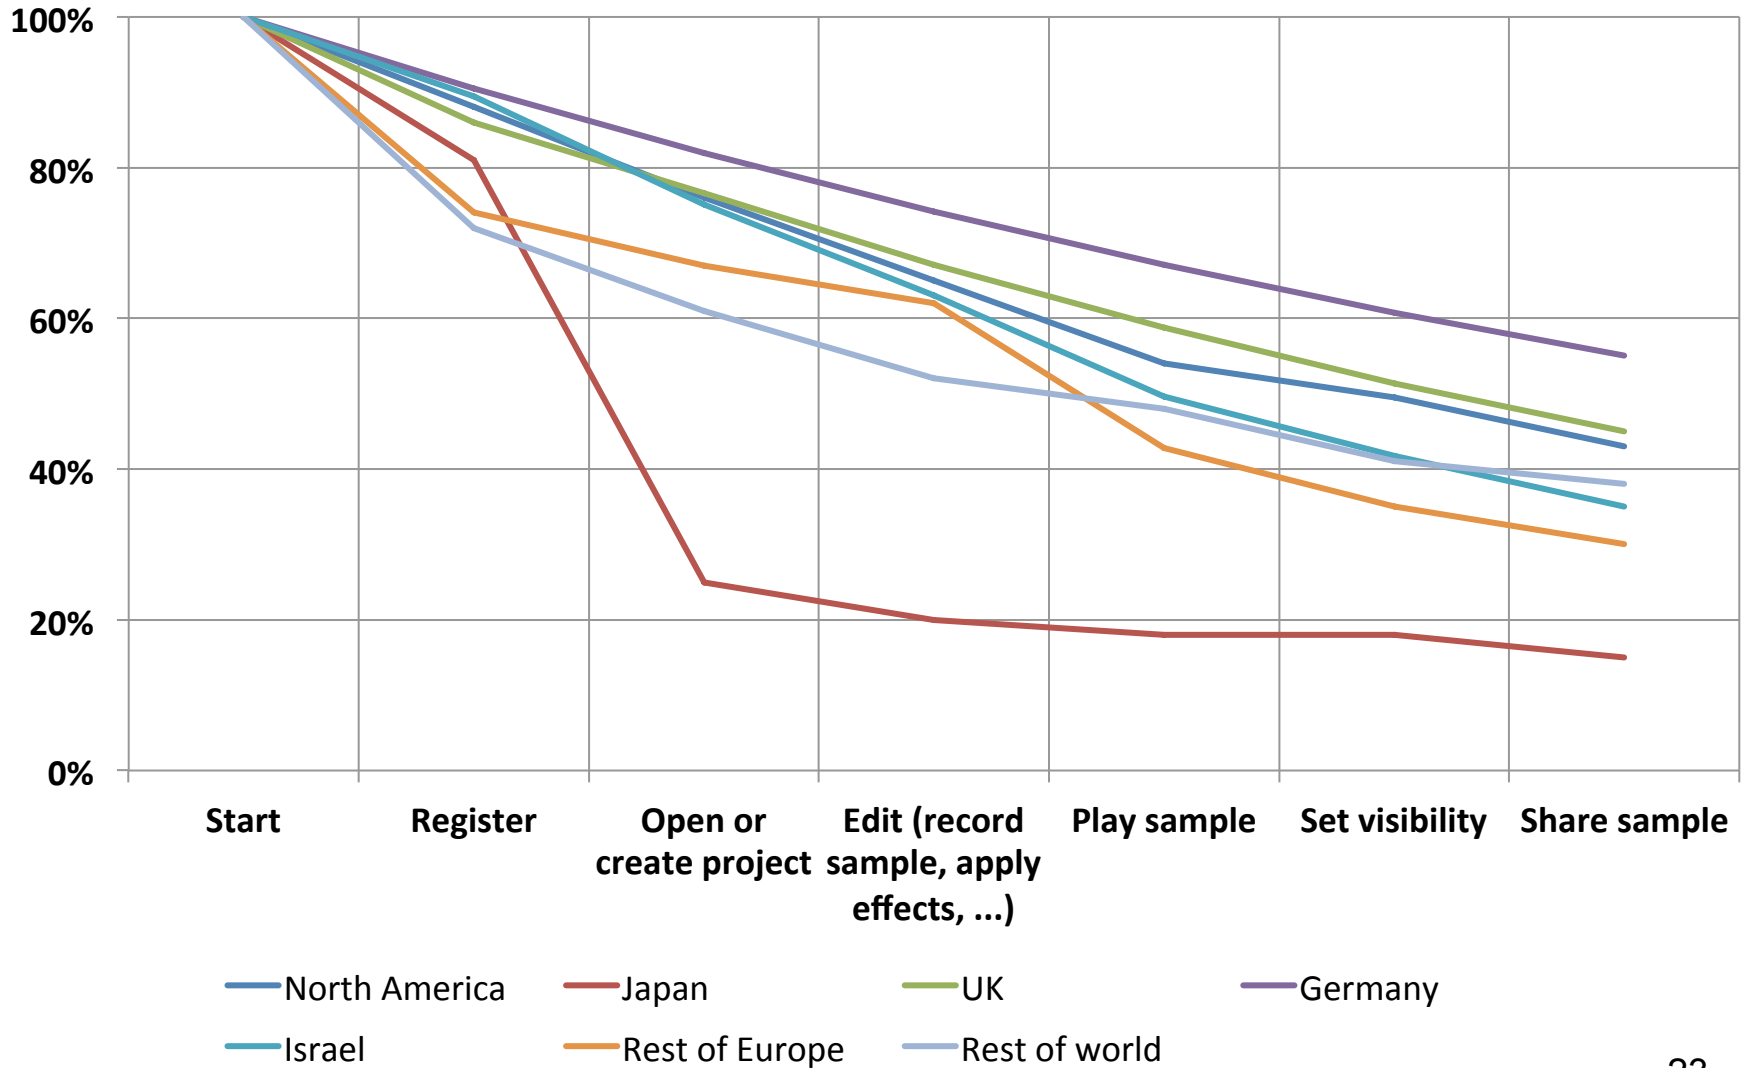

Changed By	Change Type	0 of 126 objects with changes to commit	Type	Owner
Unknown	+ New	<input type="checkbox"/> AccountNumber	User Defined Type	dbo
Unknown	+ New	<input type="checkbox"/> AdditionalContactInfoSchemaCollection	XML Schema Collection	Person
Unknown	+ New	<input type="checkbox"/> Address	Table	Person
Unknown	+ New	<input type="checkbox"/> AddressType	Table	Person
Unknown	+ New	<input type="checkbox"/> AWBuildVersion	Table	dbo
Unknown	+ New	<input type="checkbox"/> BillOfMaterials	Table	Production
Unknown	+ New	<input type="checkbox"/> Contact	Table	Person
Unknown	+ New	<input type="checkbox"/> ContactCreditCard	Table	Sales
Unknown	+ New	<input type="checkbox"/> ContactType	Table	Person
Unknown	+ New	<input type="checkbox"/> CountryRegion	Table	Person
Unknown	+ New	<input type="checkbox"/> CountryRegionCurrency	Table	Sales
Unknown	+ New	<input type="checkbox"/> CreditCard	Table	Sales
Unknown	+ New	<input type="checkbox"/> Culture	Table	Production
Unknown	+ New	<input type="checkbox"/> Currency	Table	Sales

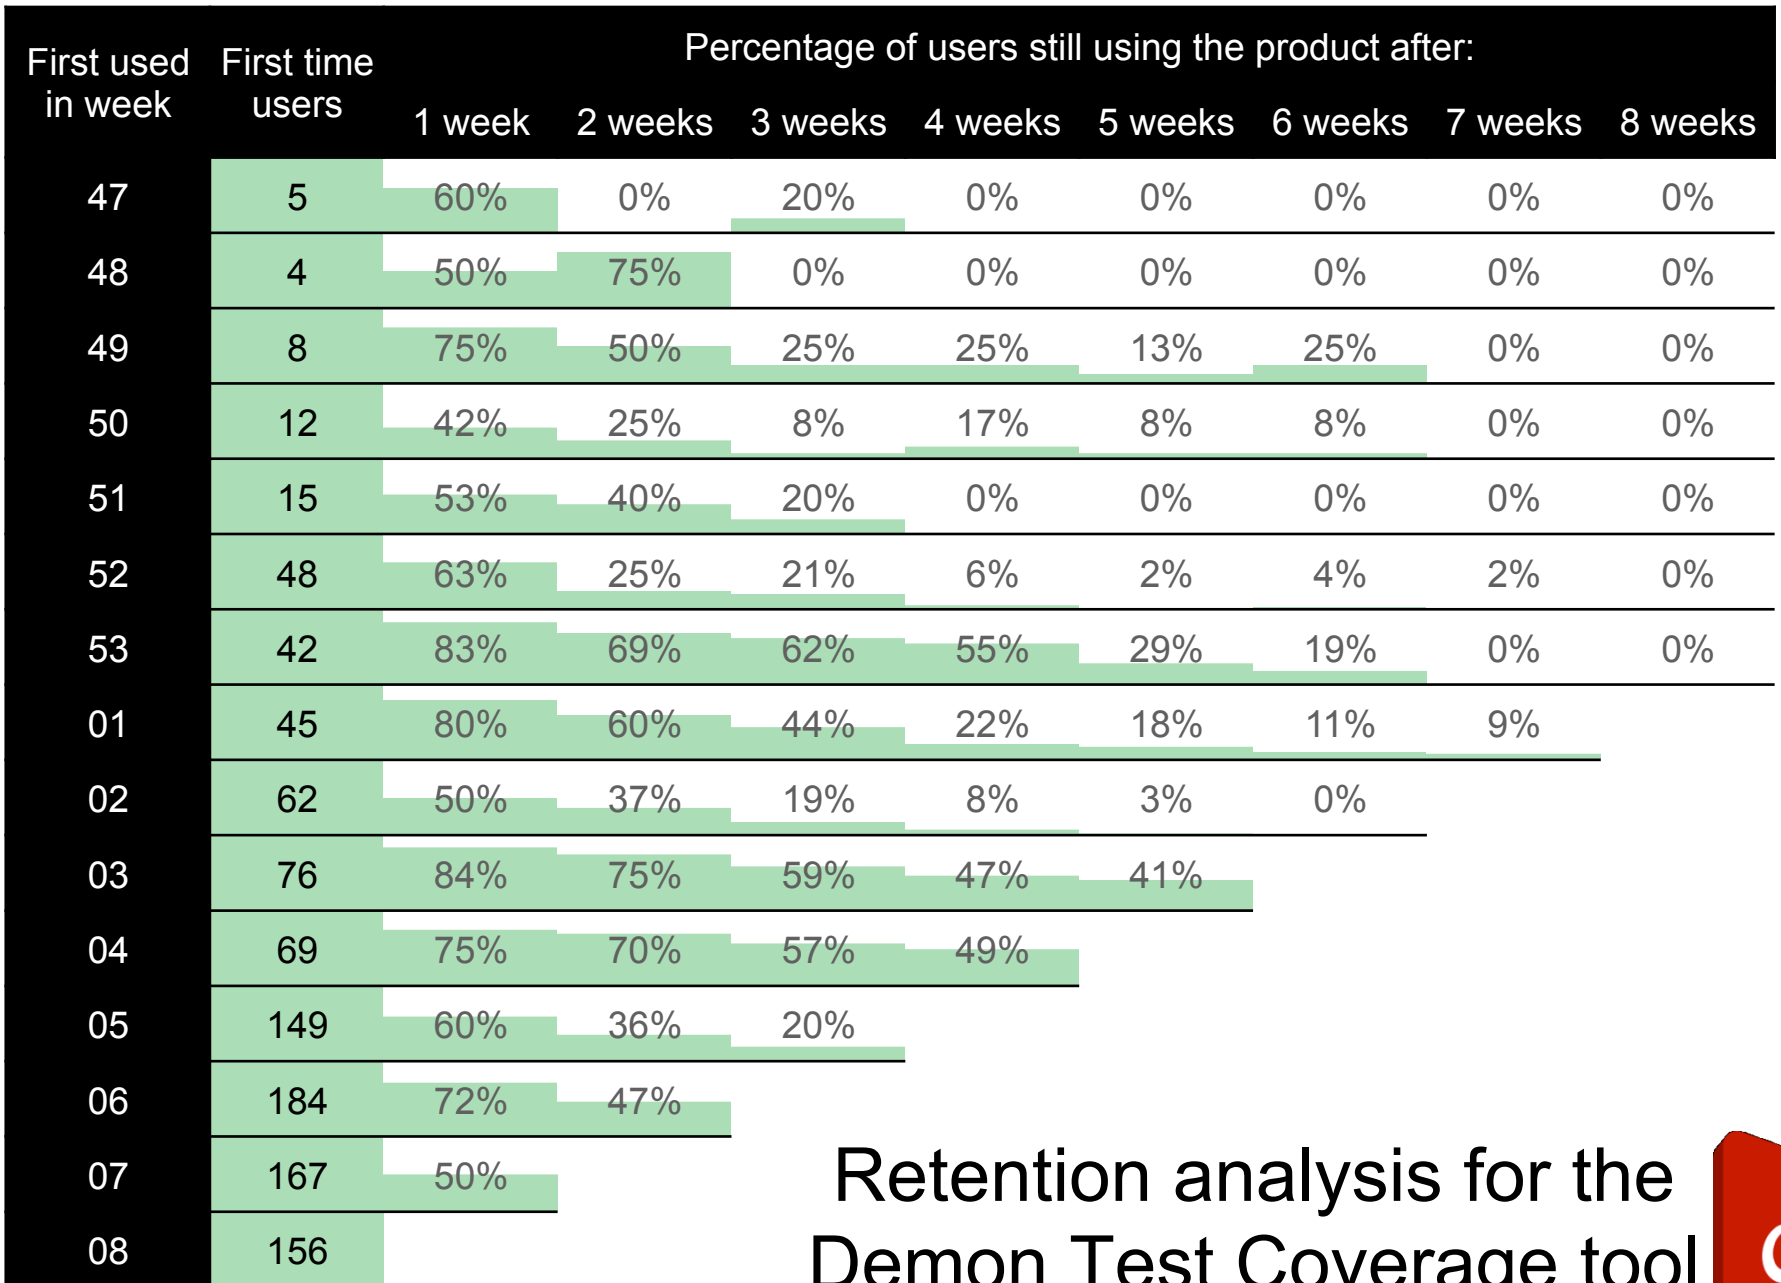

At the bottom, there are navigation buttons 'Sho \_', 'Previo', and 'Next', and a status bar showing 'Database version' and 'Latest source control version'.

# Actions the team took

- Used ApplicationMetrics to measure the actual time before the trace file were overwritten
  - Were amazed users got less than 10 minutes
- Originally planned to use more trace files
  - Which clearly wouldn't work
- Instead the team chose to keep their own record of database changes
  - Which avoided an unnecessary release

# Monitoring usage in the field

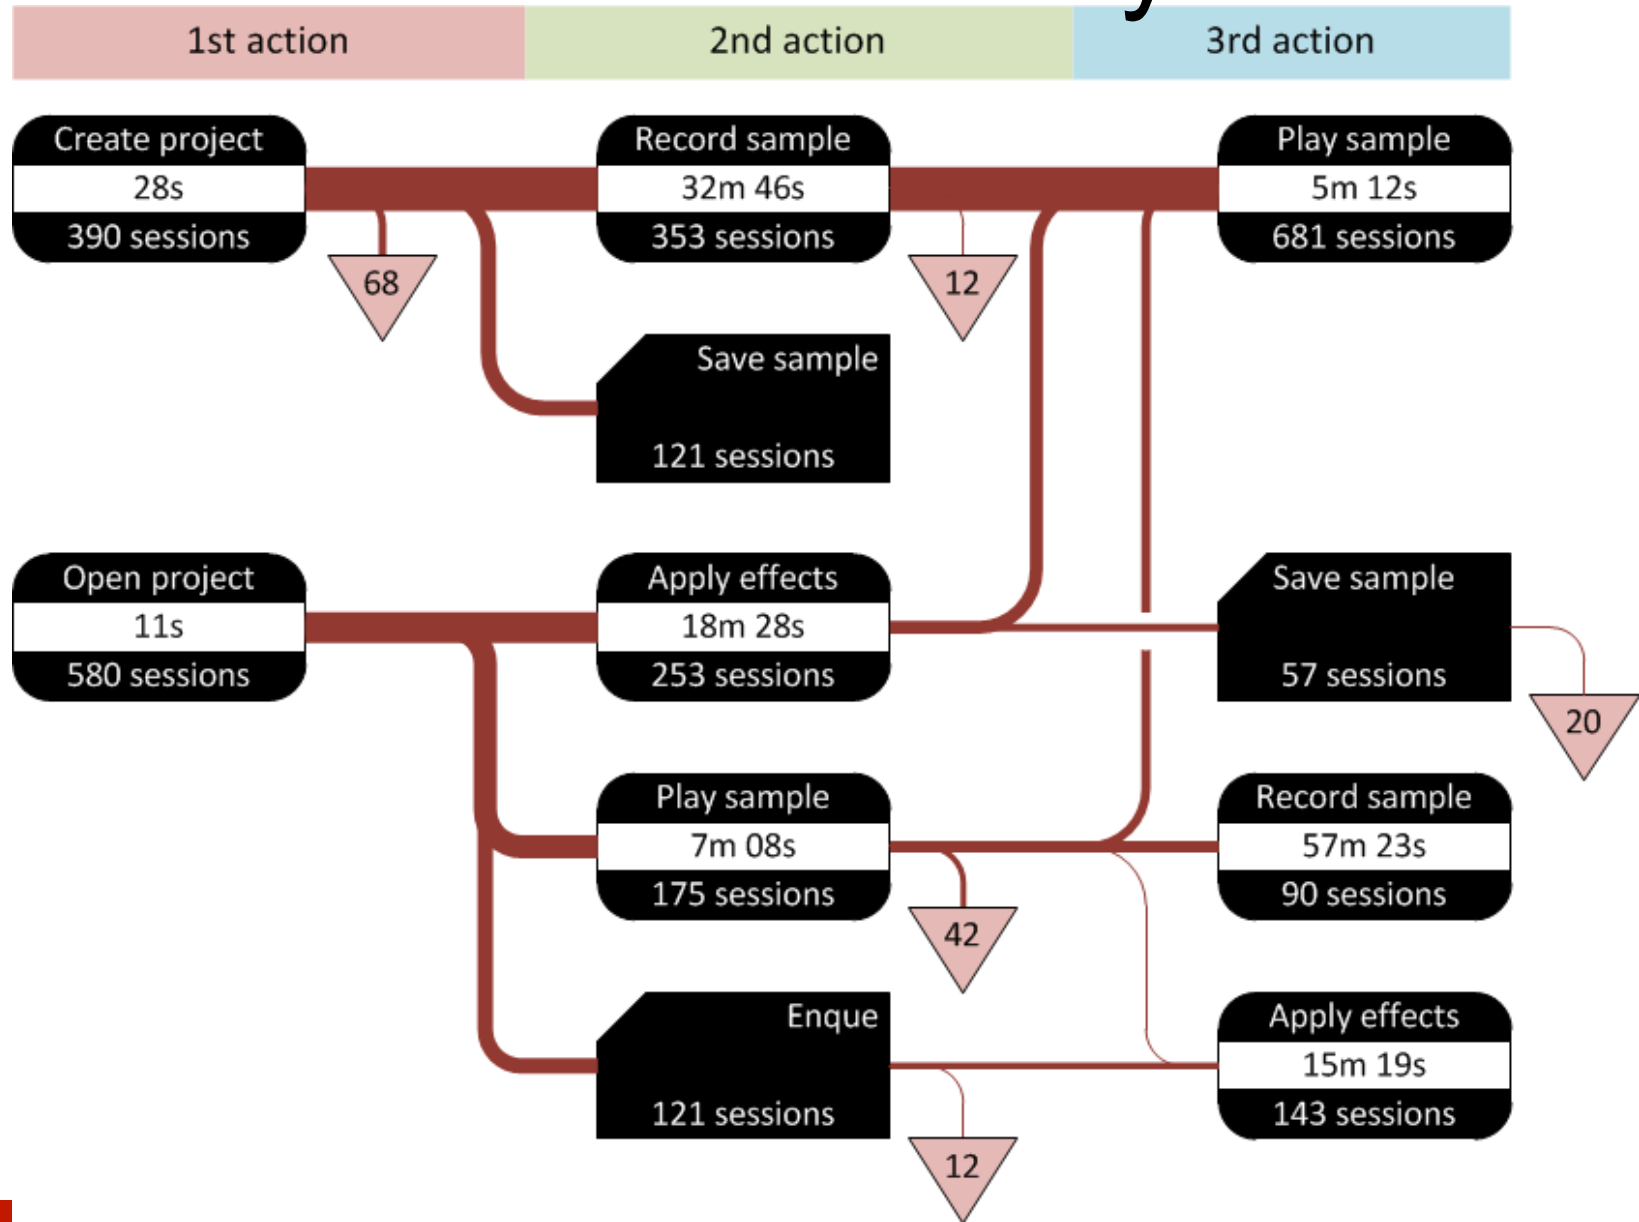

Retention analysis for the Demon Test Coverage tool

# Task flow analysis

# "Done Done"

ie the goals of the change have been achieved

- ALM integration
- Linking to a Kanban
- Choose an appropriate definition, eg
  - Feature is used at least twice by 5 users

To-do	In progress	Done	Done Done
<ul style="list-style-type: none"><li>Email alert</li><li>Regression analyser</li><li>Database restore</li></ul>	<ul style="list-style-type: none"><li>Schema comparator</li><li>Flip control</li><li>Stress test database</li></ul>	<p>Today</p> <ul style="list-style-type: none"><li>User manager<ul style="list-style-type: none"><li>✓ Add user</li><li>✓ Edit user</li><li>✓ Delete user</li></ul></li></ul>	<p>Today</p> <ul style="list-style-type: none"><li>Performance monitor<ul style="list-style-type: none"><li>✓ Performance monitor GUI</li><li>✓ Performance monitor engine</li></ul></li><li>Credentials manager<ul style="list-style-type: none"><li>✓ Enter credentials</li><li>✓ Edit credentials</li><li>✓ Challenge-response</li><li>✓ Forgotten credentials support</li></ul></li></ul>
