

# Introduction to Windows Azure and the Azure Service Platform

**Beat Schwegler**

*beatsch@microsoft.com*

Enterprise & Technical Evangelism Lead

Microsoft Western Europe

Why?

What?

How?

Why cloud computing?

What is Azure?

How to develop for Azure?

## Business Drivers for IT Projects

- **Increase market share and revenue**
  - Investing in product development and customer facing interaction channels
- **Increase efficiency and lower TCO**
  - Investing in technologies and processes to drive efficiency and lower cost through optimization

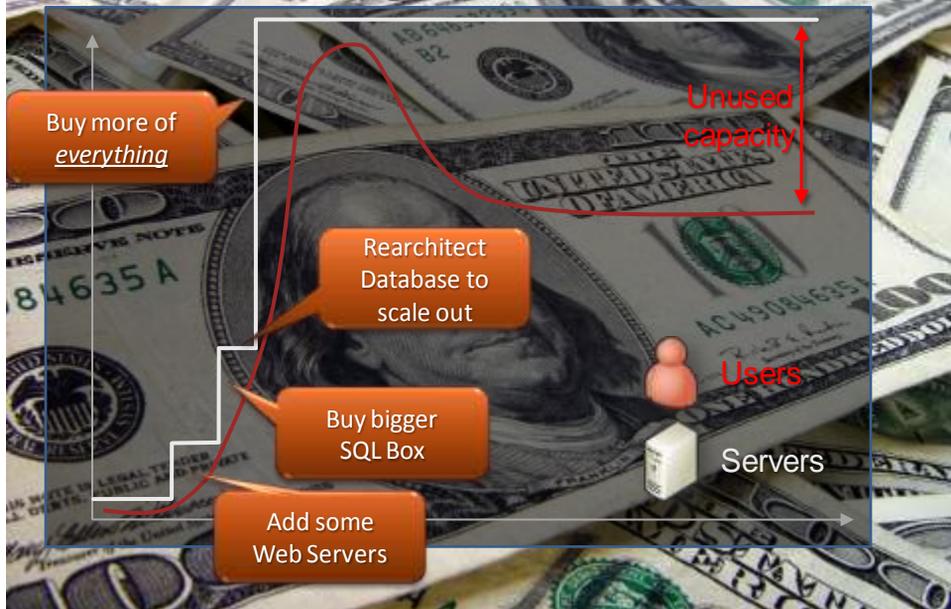

## Some Impactful Trends in IT

- Socialization of IT
- Datacenters and Green IT
- Utility Computing and IT as a Service

## Web 2.0

*“Internet applications that explicitly leverage network effects”*

## What does Success 2.0 look like?

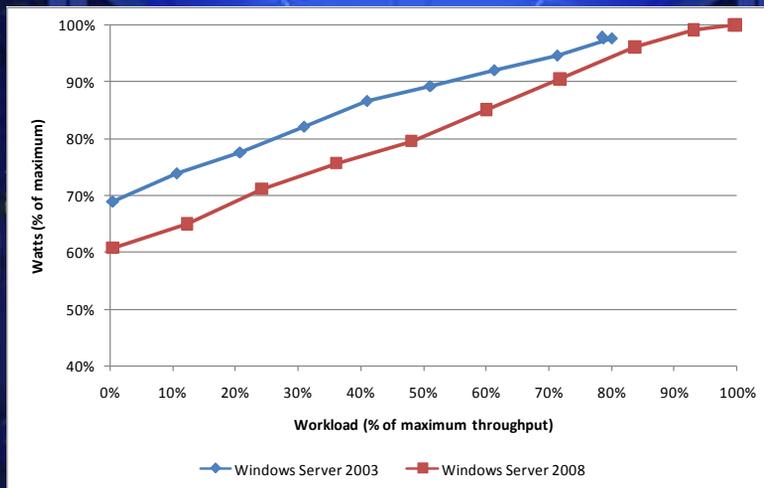

## Datacenters and Green IT

# From Mega Hertz to Mega Watt

## Optimizing Power Management

"...achieved power savings approx 10 percent or more over Windows Server 2003 OOB at comparable levels of throughput."

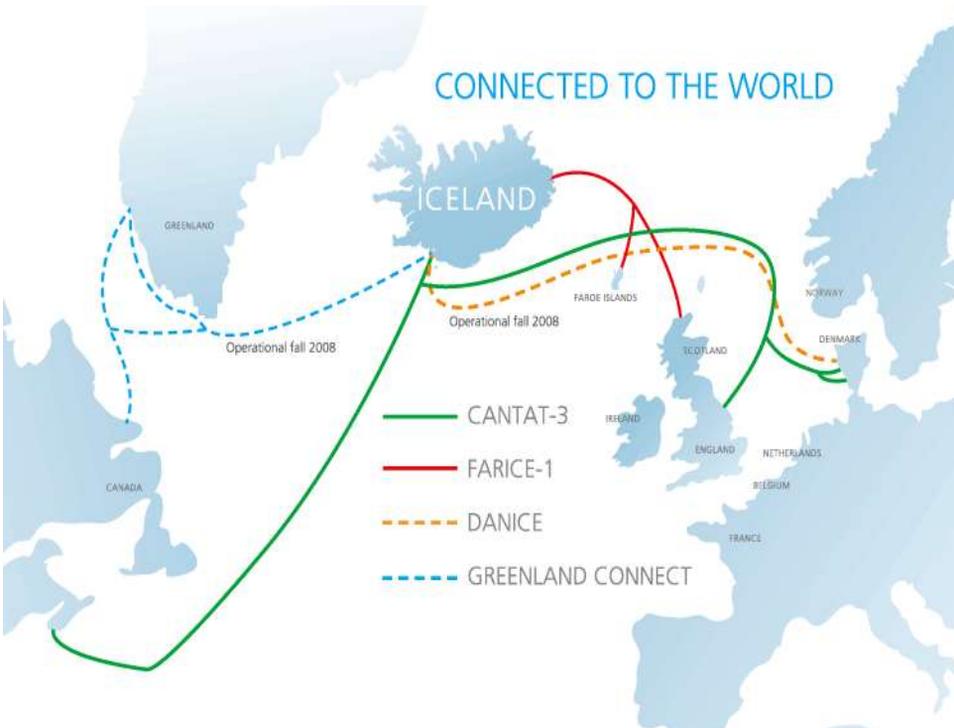

## Saving Power through Virtualization

## However ...

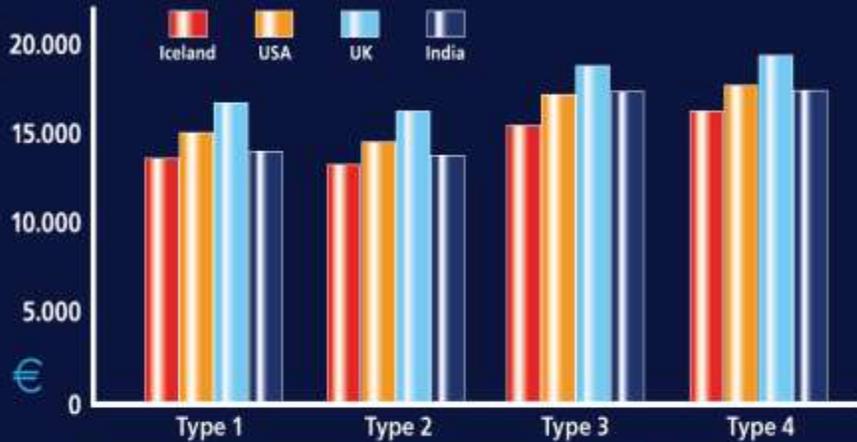

- Server power is small part of overall bill
- CPU \$\$ is less than 1% of total
  - Trend is towards more efficient CPU,
  - Lower rack power densities (amps/foot<sup>3</sup>) on horizon
- Disk is more complicated
  - Mass storage consumes more than CPU, Fan, Memory, Face drives combined
  - Keeping DB on line all the time consumes more than all CPU's involved

**The big power spend is cooling**

## Cost components for the benchmark

The combination of the 4 detailed cost components results in a favourable position for Iceland, especially thanks to the power and rental cost.

Source: PricewaterhouseCoopers, Belgium - Benchmarking Study on Iceland as a Location for Data Centre Activity.

### We're running scale services now

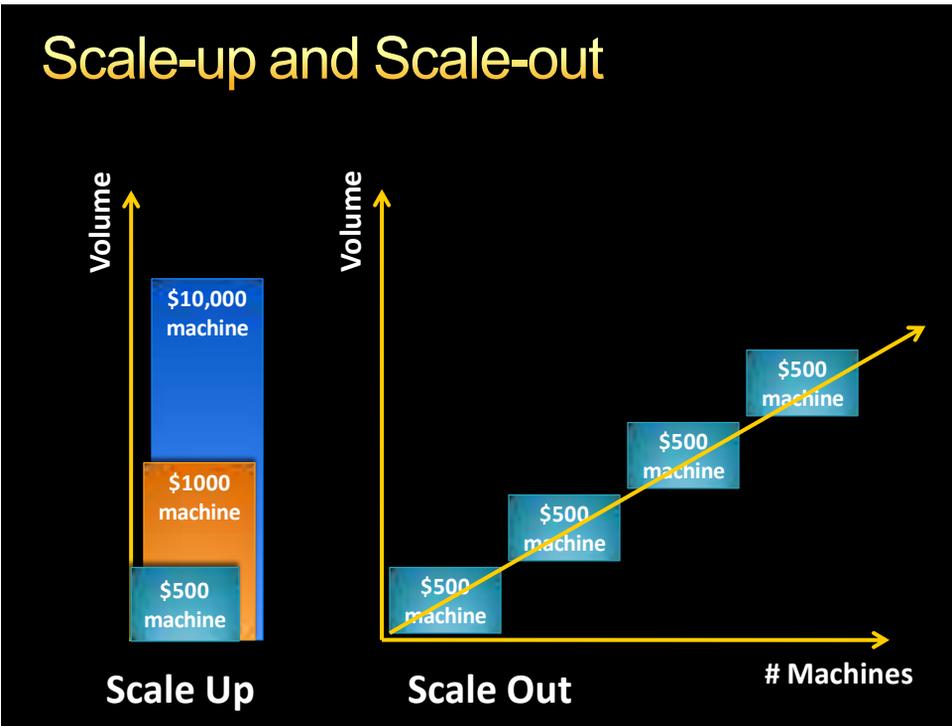

- 2 B Live Search queries/month
- 10 B MSN page views/month
- 30 B Live ID authentications/month
- 240 B Messenger messages/month

### We're building to run your services

- \$500 million per data center
- 10,000 servers/month
- \$1 B spend/FY08

## What about a Cloud OS?

- The same facilities as a desktop OS, but on a **set of connected servers**:
  - Abstract execution environment
  - Shared file system
  - Resource allocation
  - Programming environments
- And more: **Utility computing**
  - 24/7 operation
  - Pay for what you use
  - Simpler, transparent administration

## Implications

- Impacts CAPEX/OPEX spending
- May require “SOA in the large”
  - Governance
  - Identity
  - Business Processes
- New Business Model Emerge
- Introduces new Programming Models

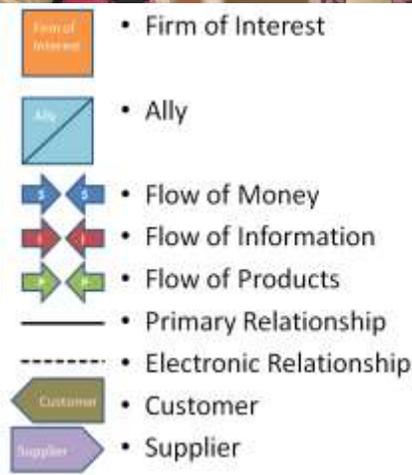

# Service Transformation - Vendor View

# Service Transformation - Customer View

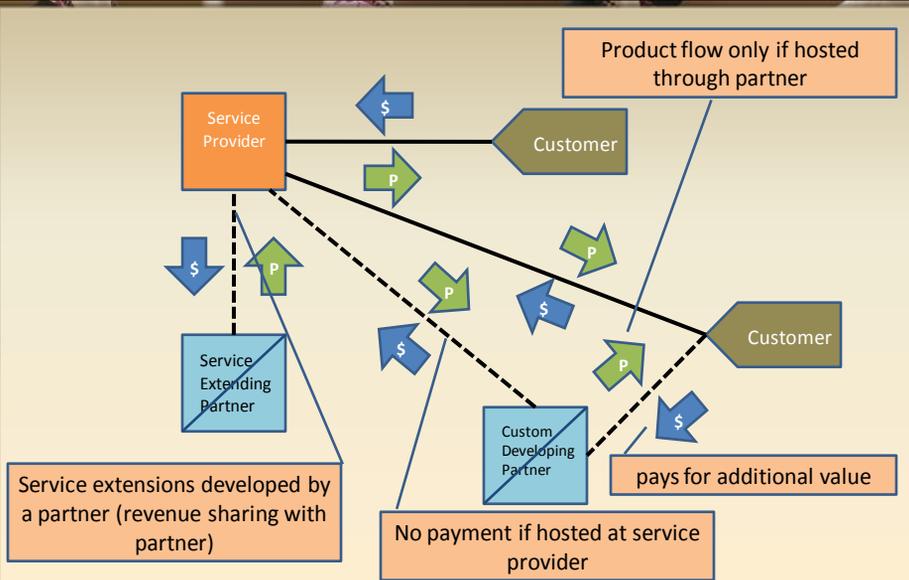

# Subscription/License Based Model

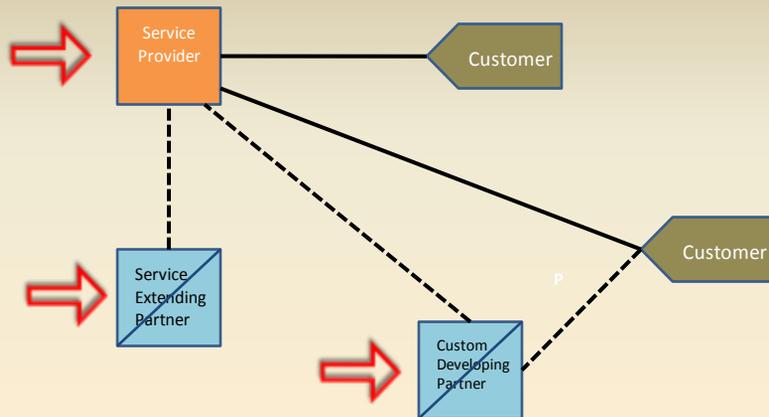

Models are based on the book „Place to Space“ by Peter Weill & Michael R. Vitale

# Service Provider Ecosystem

Models are based on the book „Place to Space“ by Peter Weill & Michael R. Vitale

## Service Provider Ecosystem

Models are based on the book „Place to Space“ by Peter Weill & Michael R. Vitale

## Programming Models for the Cloud

- Eric Brewer's **CAP** Theorem
  - **C**onsistency
  - **A**vailability
  - Tolerance to network **P**artitions
 One can only achieve a combination of two
- This leads to **BASE** semantic (vs. ACID)
  - **B**asically **A**vailable
  - **S**oft-state
  - **E**ventual consistency

# Some Useful Definitions

## Consistency Levels

Consistency Level	Changes are Visible	Example
Strong	Now	Missile Launch
Eventual	In the Future	Address Change
Optimistic	Maybe in the Future	Stock Ticker

## Message Assurances

Assurance	Message Delivery	Example
Exactly Once	No loss, no duplicates	Bank Transfer
At Least Once	No loss, duplicates	Email
At Most Once	Loss, no duplicates	Streaming Video
Best Effort	Loss, duplicates	Stock Ticker

## What does this mean for Developers?

Where did we start?	Where did we end up?
Shared State	Partitioned, Replicated State
ACID Transactions	Eventual Consistency
Exactly Once Messaging	Best Effort Messaging
Machine Loss is a Catastrophe	Machine Loss is Business As Usual
Keep Processes Running	Recovery-Oriented Computing

An internet-scale cloud services platform hosted in Microsoft data centers, which provides an operating system and a set of developer services that can be used individually or together.

## Windows Azure

- Windows Azure is the foundation of Microsoft's Cloud Platform
- It is an "Operating System for the Cloud" and provides Essential Services for the Cloud
  - Virtualized Computation
  - Scalable Storage
  - Automatic Management
  - Developer SDK

## The Backend – Physical

- Lots of racks, lots of servers, lots of wire.

## The Backend – Virtual

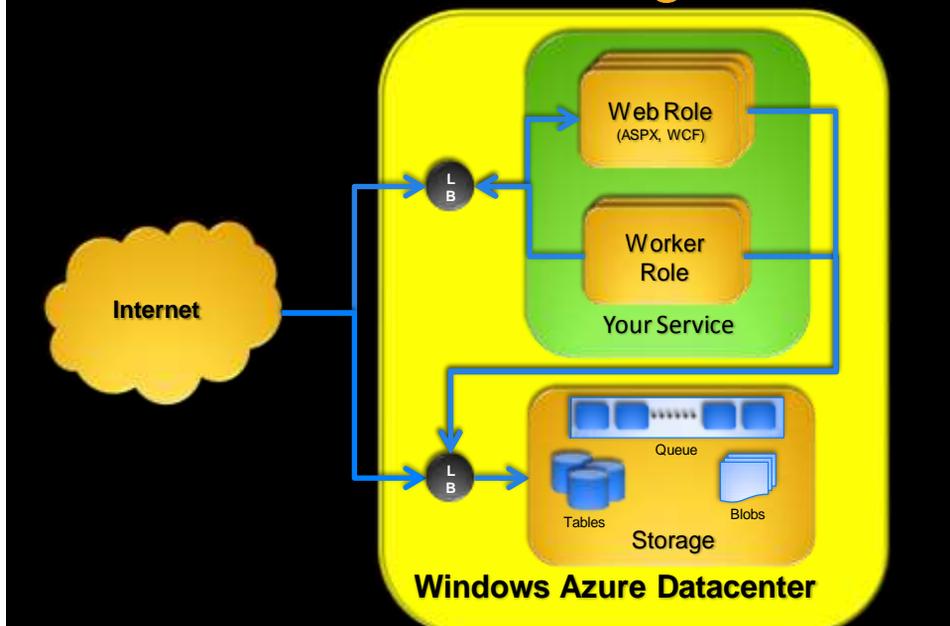

- 8+ cores per server
- 1,2,4 cores per VM
- “Lights out” model
  - VM reimaged on failure
  - Server retired on failure
- Quick deployment
  - 100 VMs in ~20 minutes
  - “Go” to “System Up”

# A Look Inside Azure

# Windows Azure Building Blocks

## Web Role

- Web farm that handles request from the Internet
- IIS7 hosted web core
  - Hosts ASP.NET
  - Managed code only
  - Supports SSL
  - Windows Azure specific CAS policy

```

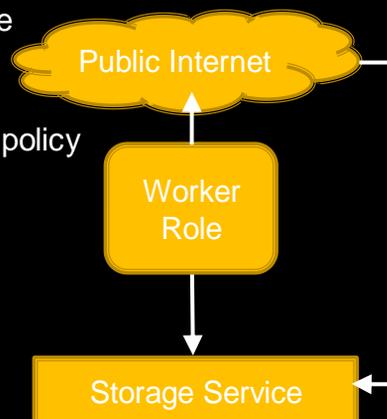

namespace HelloWorld_WebRole
{
    // ...
}

namespace TestService_WebRole
{
    [WebResource]
    public class HelloService : IHello
    {
        public string SayHello(string toWhom)
        {
            string greeter = DoDBStuff(toWhom);
            return "Hello " + toWhom + " from " + greeter;
        }
    }
}

```

## Worker Role

- No inbound network connections
- Can read requests from queue in storage
- Managed code only
- Windows Azure specific CAS policy

```

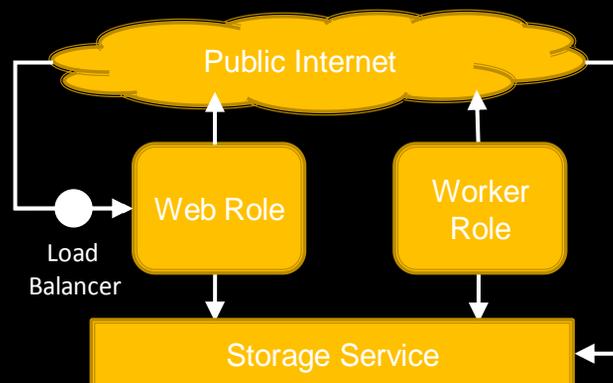

public class WorkerRole : RoleEntryPoint
{
    public override void Start()
    {
        RoleManager.WriteToLog("Information", "Worker Role Started");
        while (true)
        {
            Thread.Sleep(10000);
            RoleManager.WriteToLog("Information", "Worker Role Running");
        }
    }
}

```

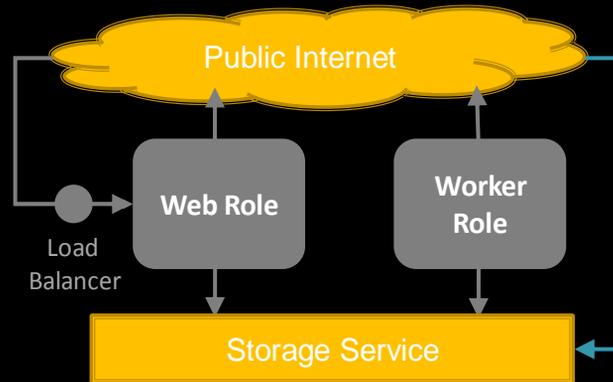

## Azure Compute Instance (Worker/Web)

- **Tech Preview** offers one type of VM
  - Platform: 64-bit Windows Server 2008
  - CPU: 1.5-1.7 GHz x64 equivalent
  - Memory: 1.7 GB
  - Network: 100 Mbps
  - Transient local storage: 250 GB
  - Azure storage also available: 50 GB
- Full service model will support more options

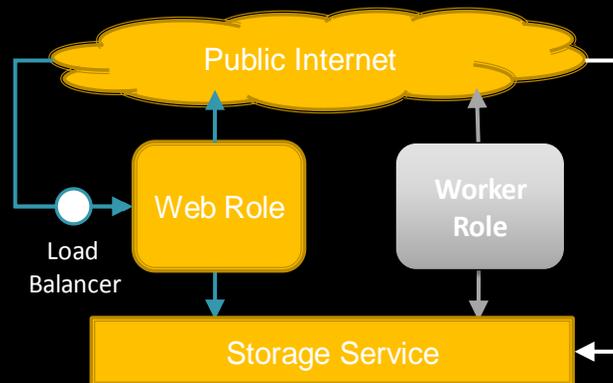

## Example Service Architecture

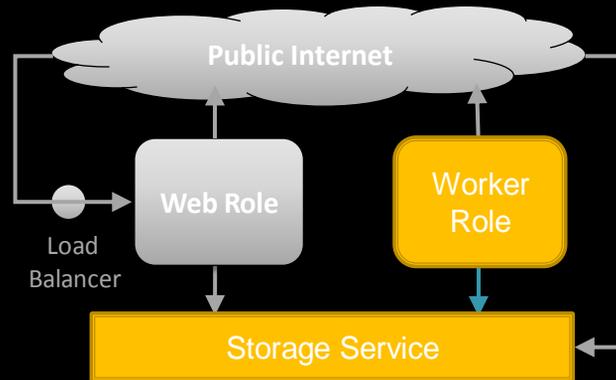

## Uploading Static Content

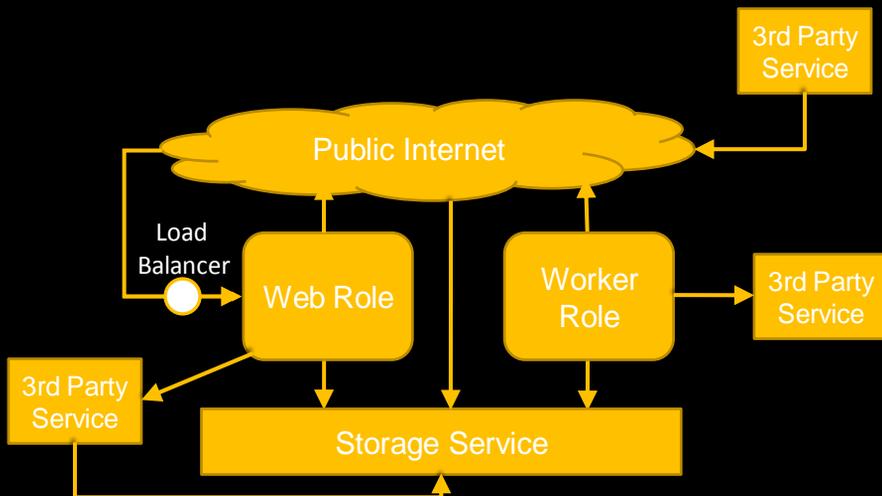

## Serving Dynamic Content

## Background Tasks

## Architecture with additional Services

# Fundamental Data Abstractions

- **Blobs** – Provide a simple interface for storing named files along with metadata for the file
- **Tables** – Provide structured storage. A Table is a set of entities, which contain a set of properties
- **Queues** – Provide reliable storage and delivery of messages for an application

Ge RemoveMessage

```

HTTP/1.1 200 OK
Transfer-Encoding: chunked
Content-Type: application/xml

DELETE
http://myaccount.queue.core.windows.net/myqueue/messages/messageid
?popreceipt=YzQ4Yzg1MDIGM0MDFiZDAwYzEw

<MessageId>5974b586-0df3-4e2d-ad0c-18e3892bfca2</MessageId>
<InsertionTime>Mon, 22 Sep 2008 23:29:20 GMT</InsertionTime>
<ExpirationTime>Mon, 29 Sep 2008 23:29:20 GMT</ExpirationTime>
  <PopReceipt>YzQ4Yzg1MDIGM0MDFiZDAwYzEw</PopReceipt>
  <TimeNextVisible>Tue, 23 Sep 2008 05:29:20GMT</TimeNextVisible>
  <MessageText>PHR1c3Q+dG...dGVzdD4=</MessageText>
</QueueMessage>
</QueueMessagesList>

```

## Tables - Capabilities

What tables don't do	What tables can do
✗ Not relational	✓ Cheap
✗ No Referential Integrity	✓ Very Scalable
If these are important to you, use: 	✓ Flexible
	✓ Durable
✗ No Aggregations	
✗ No Transactions	
✗ No Transactions	

## Data Model

- Data stored in Tables
  - A Table is a set of Entities (rows)
  - An Entity is a set of Properties (columns)
- Entity has:
  - PartitionKey – enables scalability
  - RowKey – unique id within the partition  
the only indexed property
  - Timestamp – for optimistic concurrency
  - 255 properties for your data
  - Max size of 1MB

# Working with Tables

## Vessel Position Reporting System – SQL Server

VesselId	Time	Latitude	Longitude	Speed
xxx-xx1	10:15 14 Nov	01.23	53.24	0
xxx-xx1	10:05 14 Nov	04.45	54.32	5
xxx-xx1	09:55 14 Nov	02.32	52.34	4
xxx-xx2	10:15 14 Nov	01.23	51.23	10

To find last pos report for vessel in SQL:

```
select TOP(1) * from PosRpts
order by [Time] DESC
where VesselId = ???
```

# Working with Tables

## Solving this the Azure way

PartitionKey				
VesselId	Time	Latitude	Longitude	Speed
xxx-xx1	10:15 14 Nov	01.23	53.24	0
xxx-xx1	10:05 14 Nov	04.45	54.32	5
xxx-xx1	09:55 14 Nov	02.32	52.34	4
xxx-xx2	10:15 14 Nov	01.23	51.23	10

PartitionKey

Stored in-order:  
Just need to do a  
top on the  
partition

RowKey needs to  
be a string

RowKey	Latitude	Longitude	Speed
2521756430999999999	01.23	53.24	0
2521756436999999999	04.45	54.32	5
999	02.32		

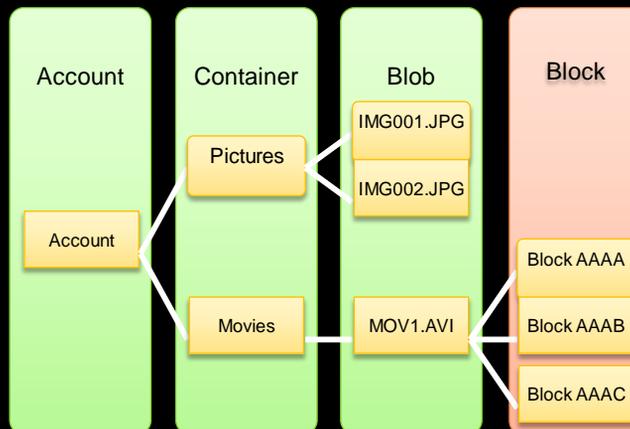

Makes it  
descending

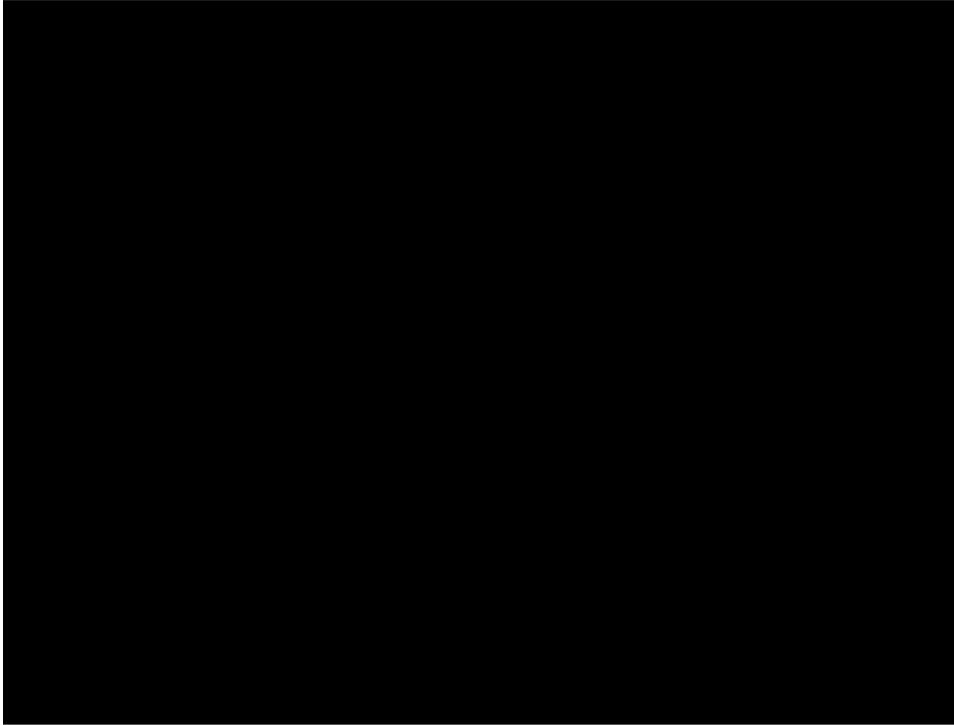

100 nanoseconds!

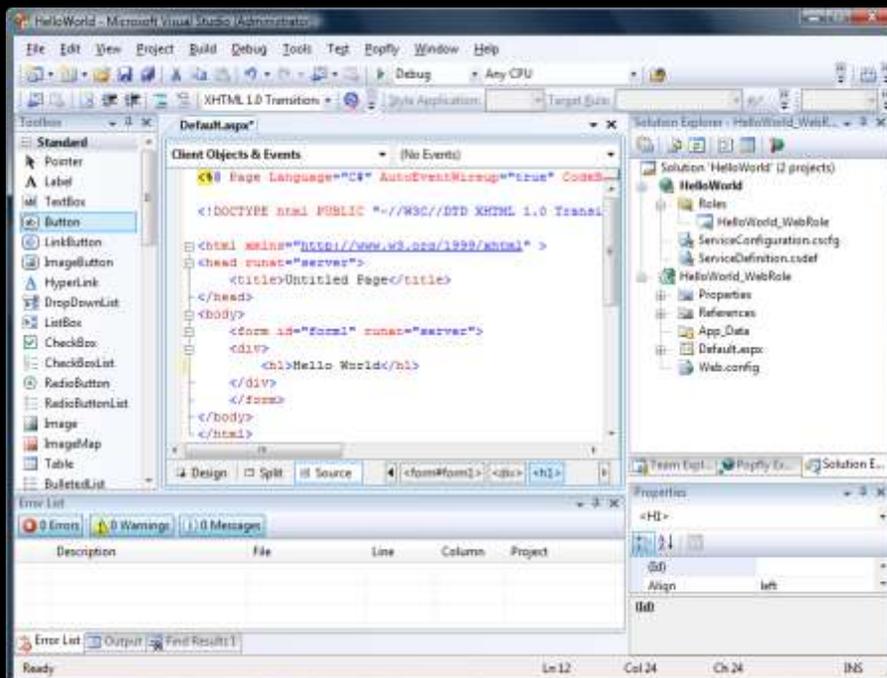

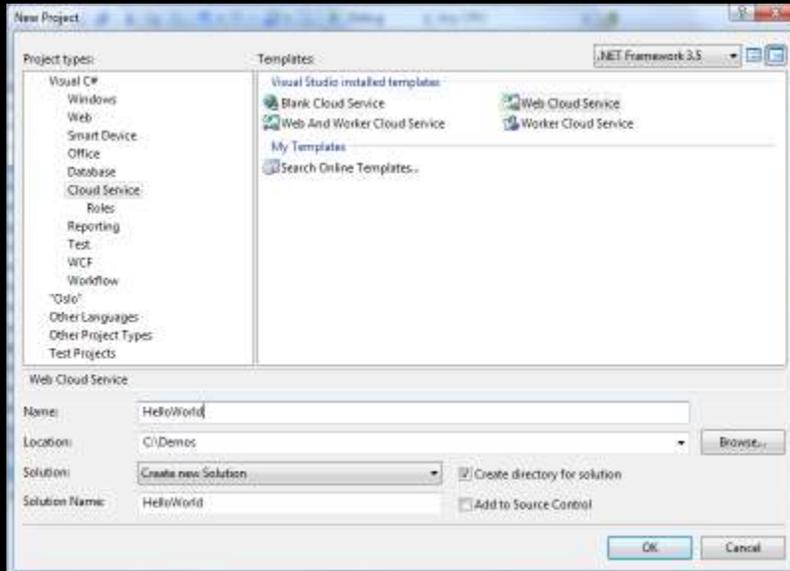

```
time.Ticks.ToString()
```

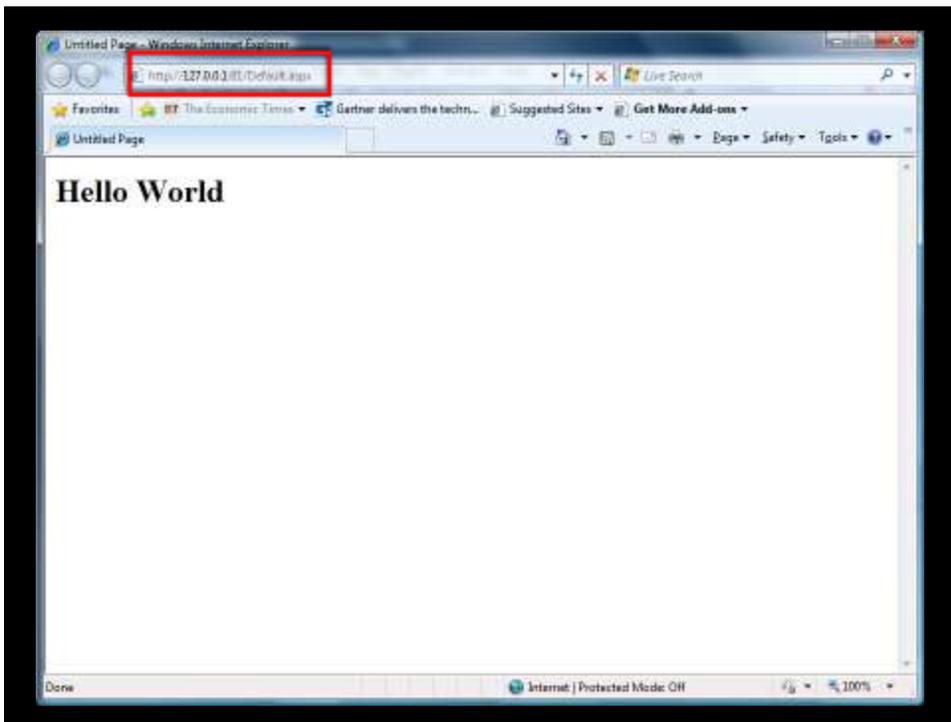

## Blobs

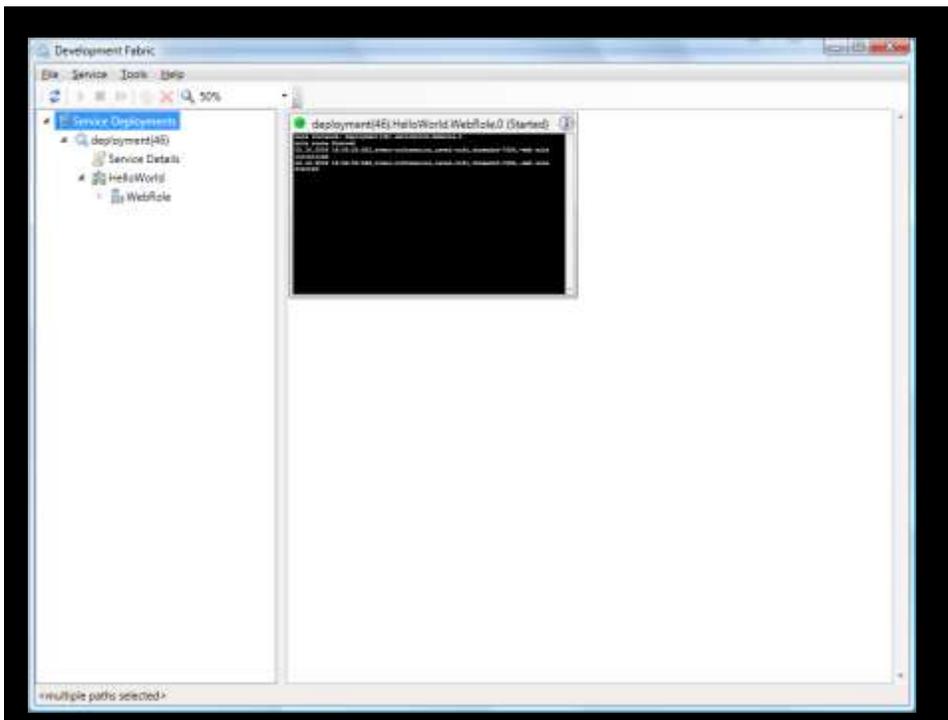

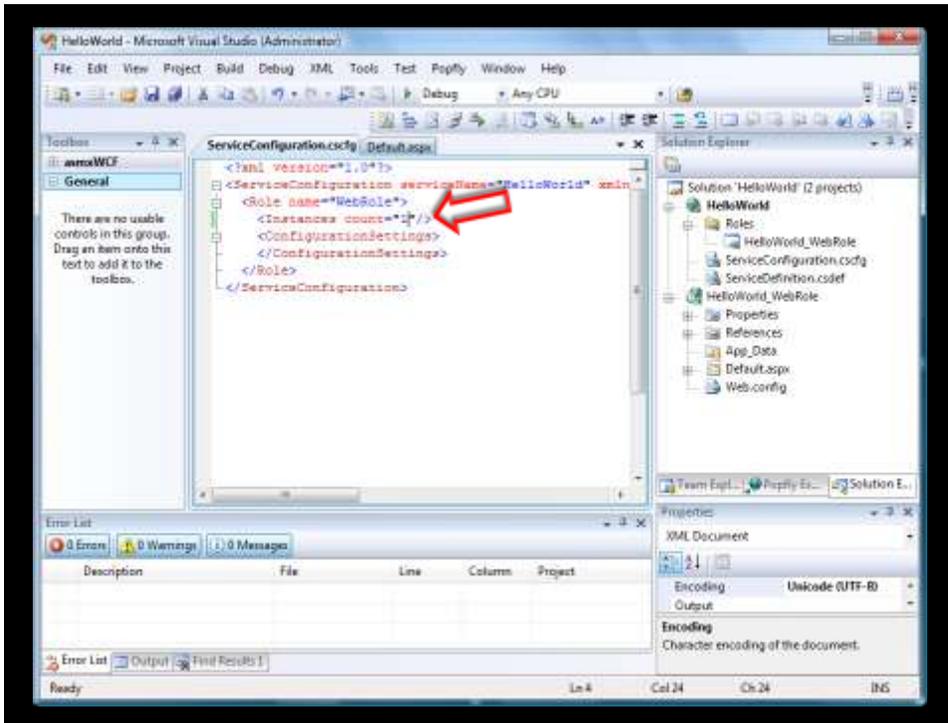

- Store Large Objects (up to 50 GB each)
- Standard REST PUT/GET/DELETE Interface  
<http://<Account>.blob.core.windows.net/<Container>/<BlobName>>

## Service Tuning

## Event Logs

Copy the event logs for this deployment to a storage account:

Copy Logs

Storage Account: 5ayHo8o

Container Name: 000000004c00772e-production

## Configuration Settings

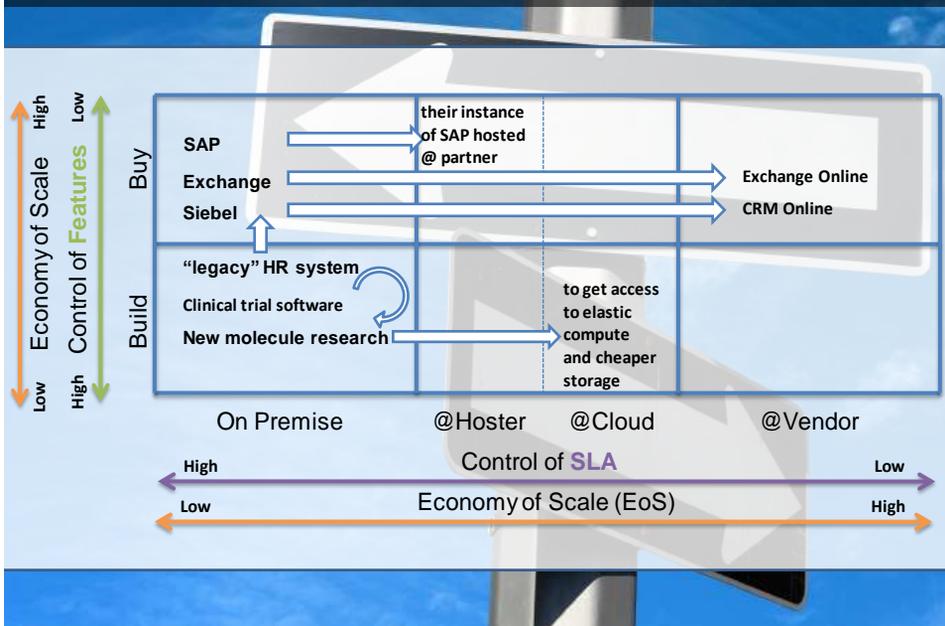

Edit the configurations:

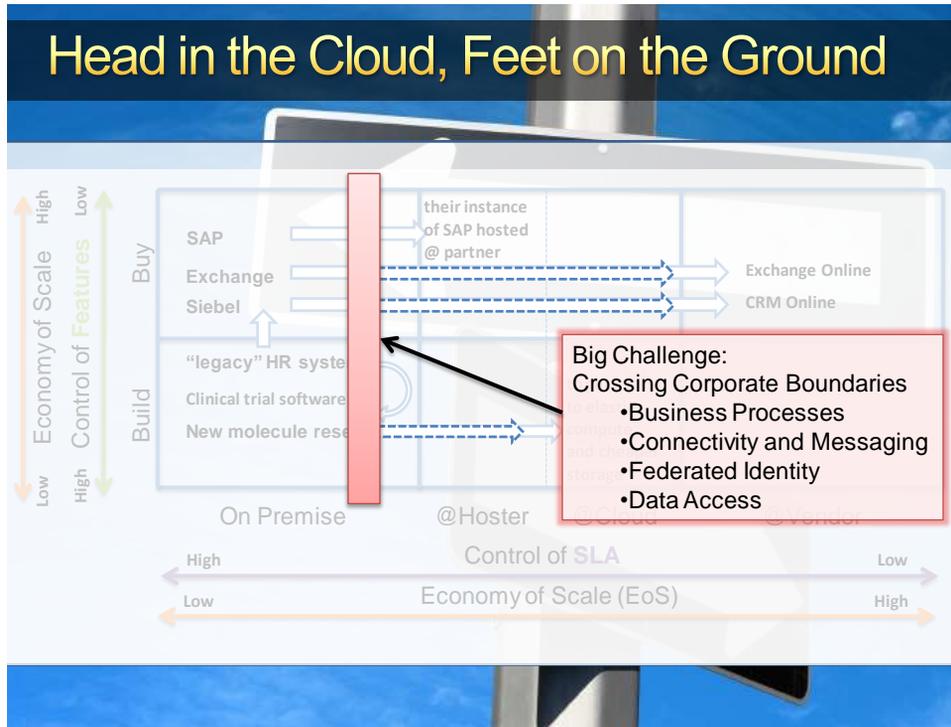

```
<?xml version="1.0" encoding="utf-16"?>
<ServiceConfiguration xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns="http://www.w3.org/2001/XMLSchema" serviceName=""
  xmlns:sm="http://schemas.microsoft.com/ServiceHosting/2008/10/ServiceConfiguration">
  <Role name="WebRole">
    <ConfigurationSettings>
      <Setting name="AccountName" value="bestach" />
      <Setting name="AccountSharedKey"
value="-----" />
      <Setting name="TableStorageEndpoint"
value="http://table.core.windows.net" />
    </ConfigurationSettings>
    <Instances count="1" />
  </Role>
  <Role name="WorkerRole">
    <ConfigurationSettings />
    <Instances count="1" />
  </Role>
</ServiceConfiguration>
```

# A Look Inside Azure

# Head in the Cloud, Feet on the Ground

## .NET Services

- Extension of .NET capabilities to the cloud
- Leverage what you know to do things that are otherwise pretty hard
- 3 Services today, more to follow
  - **.NET Service Bus**  
connectivity and fan-out messaging necessary for many integrations
  - **.NET Workflow Service**  
reliably run workflows at scale
  - **.NET Access Control Service**  
authorization based on federated identities

# Service Bus

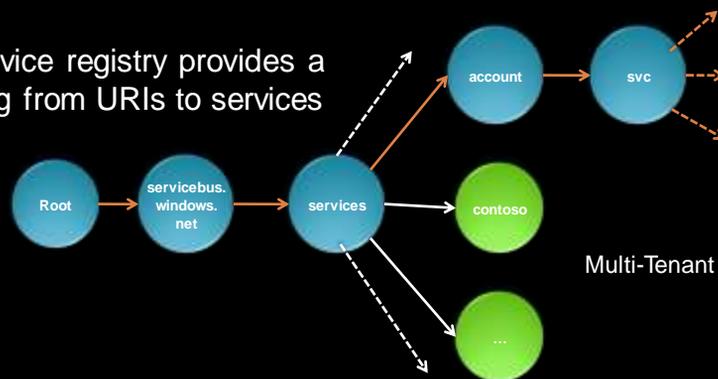

- Service Registry
- Relay and direct connect connectivity
- Publish/Subscribe
- Integrated with Access Control services

# Service Registry

[http|sb]://servicebus.windows.net/services/account/svc/...

Service Registry Root

The service registry provides a mapping from URIs to services

# One-Way Connection

sb://servicebus.windows.net/services/user/service/endpoint

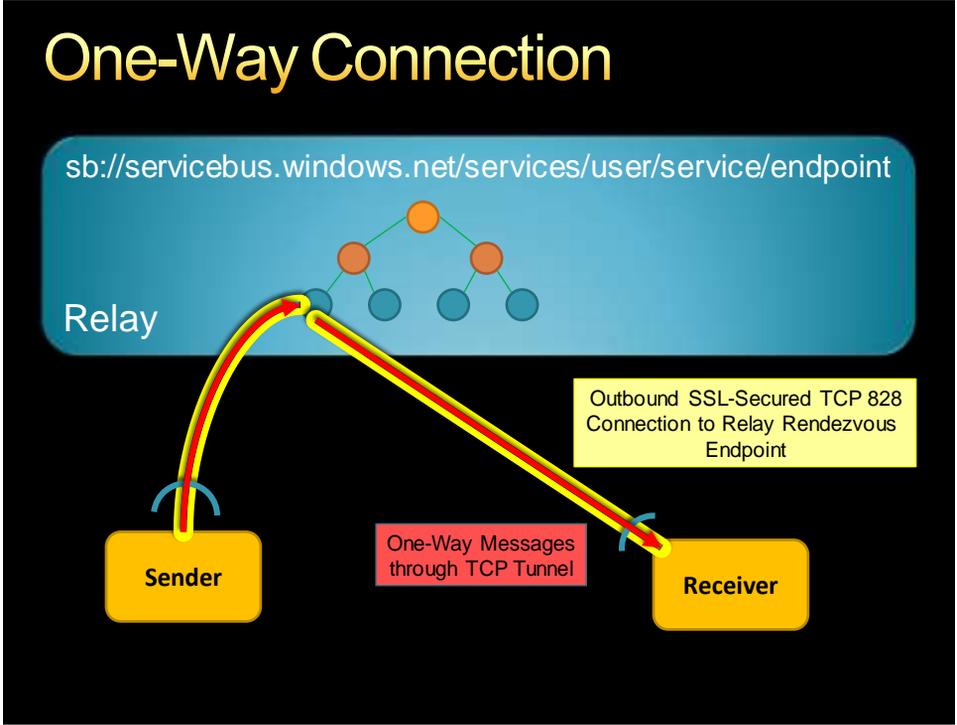

Relay

Sender

Receiver

Outbound SSL-Secured TCP 828 Connection to Relay Rendezvous Endpoint

One-Way Messages through TCP Tunnel

# Direct Connections

sb://servicebus.windows.net/services/user/service/endpoint

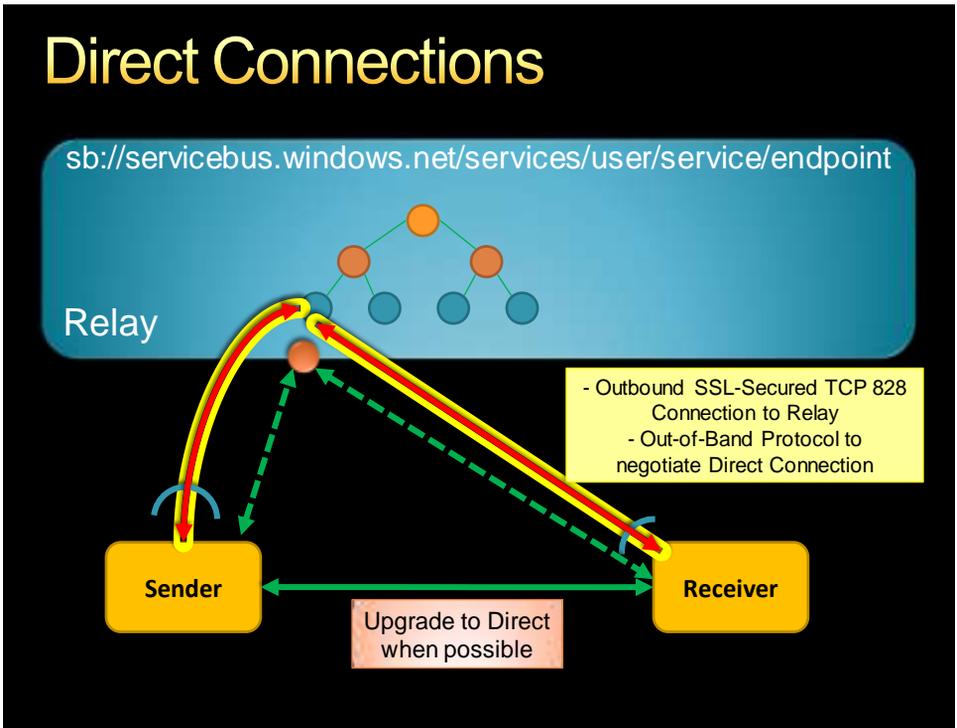

Relay

Sender

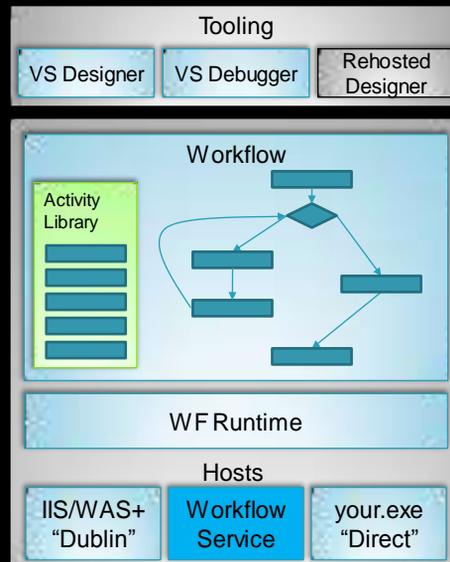

Receiver

- Outbound SSL-Secured TCP 828 Connection to Relay  
- Out-of-Band Protocol to negotiate Direct Connection

Upgrade to Direct when possible

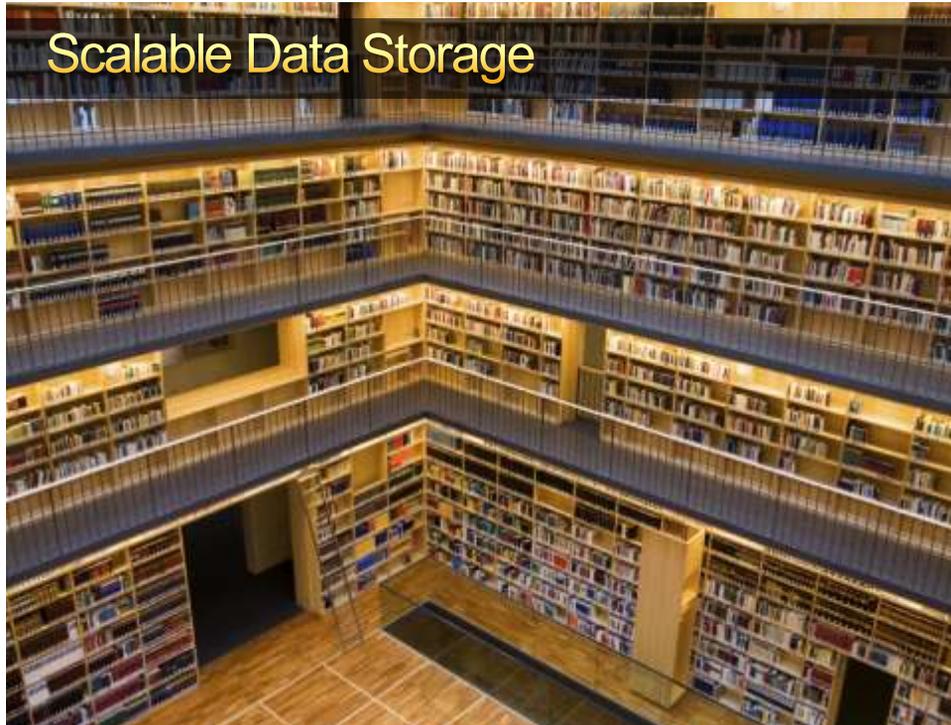

# Windows Workflow Foundation

## Workflow Service – Overview

A reliable, scalable off-premises host for workflows

- A portal at [workflow.ex.azure.microsoft.com](http://workflow.ex.azure.microsoft.com)
- New activities for the Azure Services Platform
- APIs that allow you to deploy, manage, and run your workflows on the cloud
- Enables you to orchestrate services

## Scalable, Available Data Services

- **Windows Azure Storage**
  - “Essential storage service in the cloud”
  - Provides a core set of **non-relational storage and retrieval** abstractions at massive scale
- **SQL Services**
  - “Premium database service in the cloud”
  - Extends the rich capabilities of the SQL data platform to the cloud at scale
    - **Relational data processing** over structured and unstructured data
    - Integrate with key data platform capabilities – e.g. Data Analytics, Reporting, ETL

# SQL Services Futures

Extending the SQL Data Platform to the cloud

- Data services tier of the Azure Services Platform
- Built on SQL Server foundation
- Broad data platform capabilities as a service
  - Friction-free provisioning, scaling
  - Significant investments in scale, HA, lights-out operation and TCO

## ~~Data Model And ACE Concepts~~

### ~~Authority~~

- Unit of geo-location and billing
- Tied to DNS name
- Collection of Containers

### ~~Container~~

- Unit of Consistency
- Scope of Query and Update
- Collection of Entities

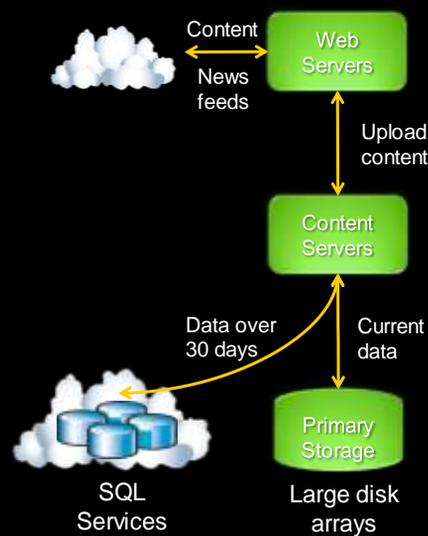

### ~~Entity~~

- Unit of Storage
- Property Bag of Name/Value pairs
- No Schema required

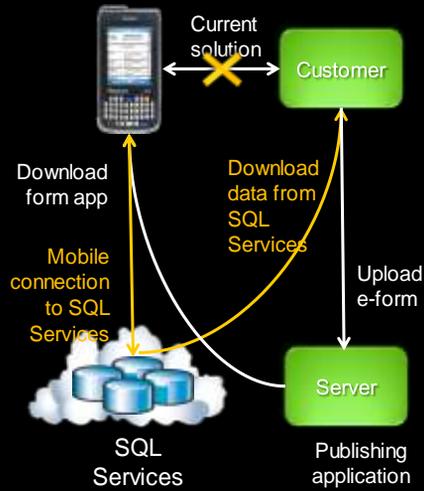

## SQL Services supports Tabular Data Stream

- Tables
- Stored Procedures
- Triggers
- Views
- Indexes
- Visual Studio Compatibility
- ADO.Net Compatibility
- ODBC Compatibility

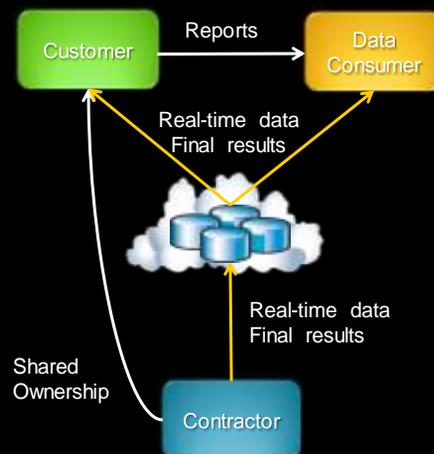

## Scenario - Archival of Syndicated Content

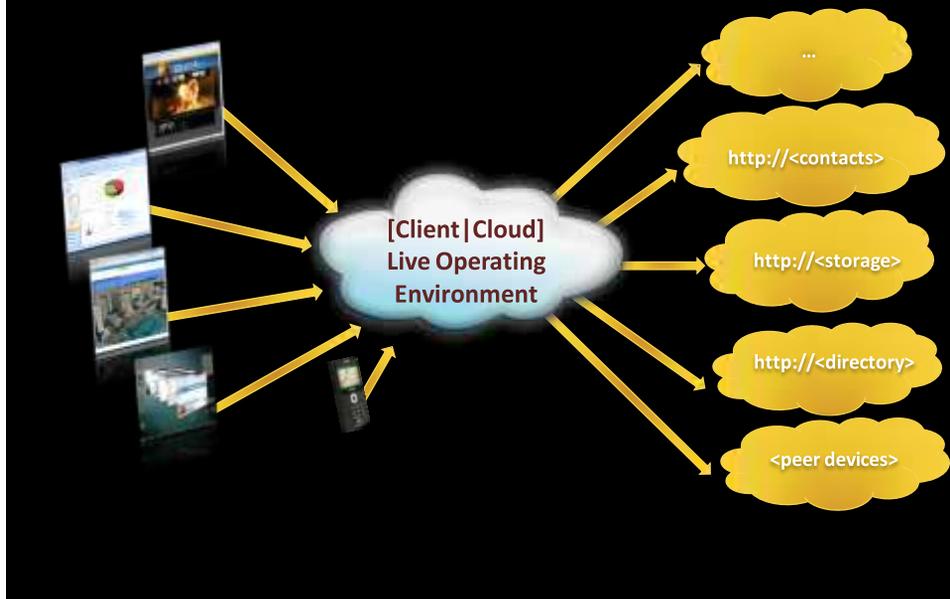

## Scenario - Mobile Forms

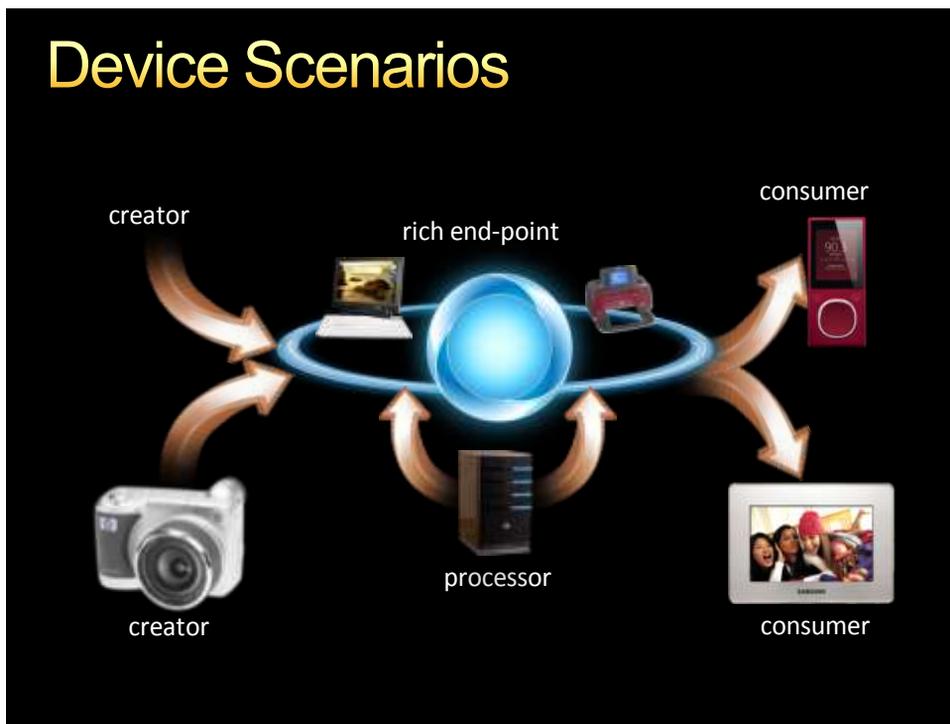

## Scenario - B2B Data Sharing

## Live Operating Environment

## Device Scenarios

## Closing Thoughts

The Web-Tier provides tremendous opportunities

Windows Azure – An OS in the cloud for developing and running applications in the Web-Tier

Azure Service Platform – S+S building blocks
